# 1. Introduction

The Kent and East Sussex Railway (KESR), originally opened in 1900, is the world's first light railway and is currently a major tourist attraction in this region. The railway runs between Tenterden in Kent and Bodiam in East Sussex and the Rother Valley Railway (RVR) Heritage Trust, a registered charity, is currently reconstructing the railway line in East Sussex that historically linked Bodiam to Robertsbridge as an extension to the KESR.

Three level crossings are being considered on this route; their locations are shown on **Figure 1.1**. The crossings are:

- Crossing 1 – on Northbridge Street an unclassified road west of the A21, approximately 300 m south west of the roundabout at the junction of A21(T), Church Lane and Northbridge Street;
- Crossing 2 – on the A21(T) Robertsbridge bypass approximately 140m south of the roundabout; and,
- Crossing 3 – on the B2244 Junction Road, approximately 6 km south of Hawkhurst.

Figure 1.1: Level crossing locations

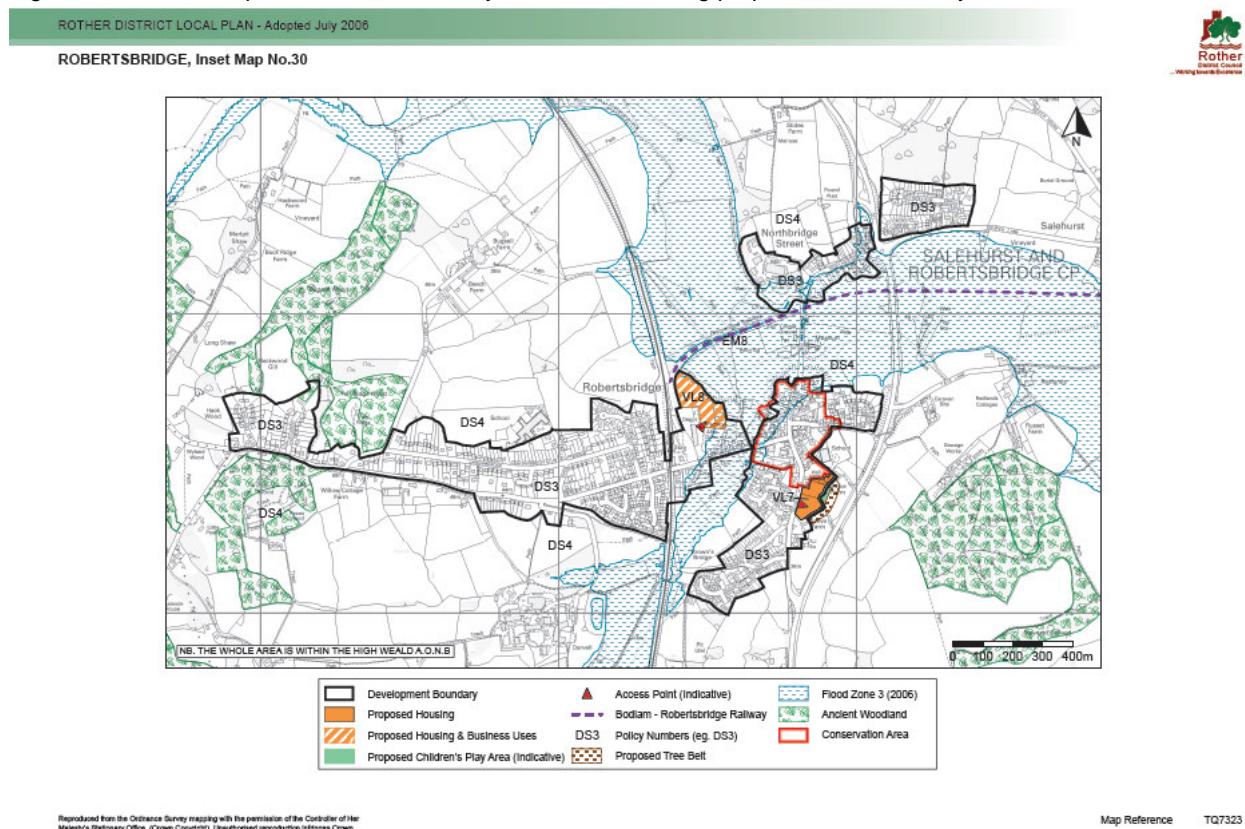

Source: Background Mapping - Ordnance Survey data © Crown copyright and database right 2010

The route of the Rother Valley railway line, indicated on **Figure 1.1**, is included on the proposals maps forming part of the Rother District Local Plan adopted in July 2006, see **Figure 1.2**.

# Rother Valley Railway : Proposed Level Crossings Traffic Impact Study

Figure 1.2: Inset map 30 from Rother Valley Local Plan showing proposed line of railway

Source: Rother Valley District Council <http://www.rother.gov.uk/media/pdf/0/3/Inset30.pdf>

The Rother District Council is supportive of the proposal for the railway, as set out in Policy EM8 of the Local Plan:

*"Policy EM8 : An extension to the Kent and East Sussex Steam Railway from Bodiam to Robertsbridge, along the route identified on the Proposals Map, will be supported, subject to a proposal meeting the following criteria:*

- (i) it must not compromise the integrity of the floodplain and the flood protection measures at Robertsbridge;*
- (ii) it has an acceptable impact on the High Weald Area of Outstanding Natural Beauty;*
- (iii) it incorporates appropriate arrangements for crossing the A21, B2244 at Udiam, Northbridge Street and the River Rother."*

Mott MacDonald has been commissioned by Rother Valley Railway Limited (RVR) to undertake a traffic impact assessment of the provision of level crossings at these three crossing points, the aim of this report being to address the road traffic impact resultant from the provision of the level crossings in para (iii) above.

The detailed design of the level crossings and their operation is being undertaken by others. RVR provided a technical note outlining the background legislation, details of each crossing location and how they would operate and examples elsewhere of similar level crossings on heritage railways. Preliminary drawings showing the layout and associated traffic signing for each crossing were also provided by RVR. The proposed crossings would be gated with modern automatic type lifting barriers extending over the full width of the carriageway. The technical note and accompanying drawings are included in **Appendix A**.

The Office of Rail Regulation/HM Inspector of Railways (ORR/HMIR) have commented on an earlier draft of this report and a letter dated 24<sup>th</sup> August 2011 summarising their comments is included in **Appendix B**. As a result of the advice provided by ORR/HMIR in the letter, the assumptions made in the analysis regarding crossing closure duration have been amended. The assumption of the normal barrier closure duration has been increased from 45 to 51 seconds and the assumption regarding the maximum expected closure time from 60 seconds to 112 seconds. Consideration has also been given to the need for a central reserve barrier on the A21 in the vicinity of the level crossing designed to minimise drivers abusing the crossing by weaving around the barriers when closed.

Following this Introductory Section, the remainder of this Report is structured as follows:-

**Section 2** Outlines the study methodology.

**Section 3** Sets out the existing conditions including features of the highway network on the approaches, traffic flows and the road safety record at each proposed crossing location.

**Section 5** The results of the traffic data analysis and the vehicle queuing forecasts at the level crossings using a spreadsheet model are outlined. The impact of the queuing on the road network is reviewed and road safety issues considered, including speed limits and the potential for a central reserve barrier at the A21 crossing location.

**Section 6** Conclusions are drawn and recommendations made.

## 2. Study Methodology

### 2.1 Introduction

A draft daily train timetable has been provided by RVR on the basis that 5 to 7 trains per day would run on the proposed railway line as an extension to the existing services on the KESR. Days of operation would normally be within the hours indicated by the timetable. In order to establish the potential impact on the road network of the introduction of level crossings at the locations shown in **Figure 1.1** traffic flow data has been obtained from the relevant highway authorities.

A spreadsheet model was developed to estimate the length of queue build up as a result of barrier closures on a variety of days in the spring/autumn and summer periods that the railway would operate, including Bank Holidays. Hourly traffic flow data for 2010 has been input to the model, together with details of train times and the duration of a barrier closure. The number of barrier closures per day would range from 10 to 14. The anticipated opening date of the RVR is between 5 and 10 years, therefore traffic forecasts have been prepared for 2016 and 2021.

The model outputs include the average and maximum queue length for the day being modelled.

### 2.2 Data Collection

#### 2.2.1 Traffic flows

East Sussex County Council has provided traffic data for 2010 relevant to the level crossing locations on C18 Northbridge Street and B2244 Junction Road as follows:

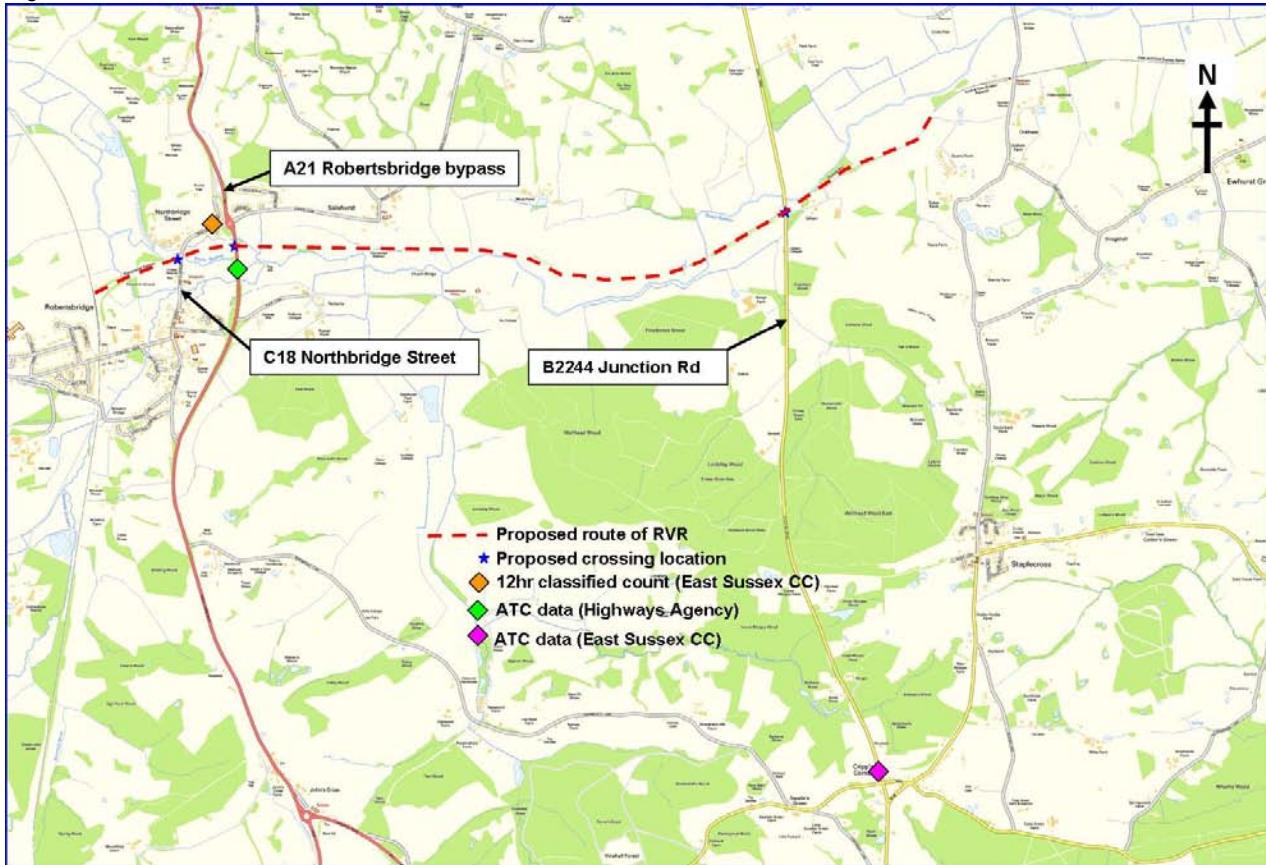

- C18 Northbridge Street – hourly traffic flows in each direction over a 12 hour period, 07:00 to 19:00, on Tuesday 14<sup>th</sup> September 2010 from a classified turning count at the A21/Northbridge Street/Church Road roundabout, (Site reference 84A) . Data from a similar survey on 19<sup>th</sup> October 2008 has also been supplied by the Council.
- B2244 – hourly traffic flows in each direction from an automatic traffic counter (ATC) located on Junction Road at Cripps Corner recording traffic data from 01/04/2010 to 01/09/2010 (site ref 00000021)

The Highways Agency publishes traffic data collected from ATC's at various locations on the trunk road and motorway network on their TRADS2 website (<http://trads.hatris.co.uk/>). Data for the whole of 2010 is available and hourly traffic flows have been downloaded for use in this study from two sites on the A21:

- Site no T/04/215 – southbound on the A21 Robertsbridge Bypass southern section (Grid reference E574125, N124015)
- Site no T/04216 – northbound on the A21 Robertsbridge Bypass southern section (Grid reference 574128, N123929)

The location where traffic data has been collected on the C18, A21 and B2244 are indicated on **Figure 2.1**. The raw traffic data used in the analysis for this study is included in **Appendix C**.

Figure 2.1: Traffic data location on B2244

Source: Background Mapping - Ordnance Survey data © Crown copyright and database right 2011

Traffic count locations - East Sussex County Council and the Highways Agency <http://trads.hatris.co.uk/>

## 2.2.2 Accident data

Personal Injury Accident (PIA) data was obtained from Sussex Police. Data for the most recent 5 year period was requested and the data supplied covered the period 1<sup>st</sup> November 2005 to 30<sup>th</sup> November 2010. The purpose of obtaining historic accident data is to review the current road safety record in the vicinity of each of the proposed level crossing sites. The road safety record will inform the assessment of the physical extent of any necessary changes to speed limits required on the approaches to the crossings. An assessment has also been made of the potential impact of the introduction of level crossings on the road safety record, either positive or negative.

## 2.2.3 Proposed timetable and days of operation

Information on the possible train timetabling and normal days of operation for the RVR has been obtained from the RVR and by reference to the KESR website.

The draft timetable for the RVR, included in **Appendix D**, shows that normally there would be between 5 and 7 trains running (10 to 14 barrier closures) within the hours indicated on the timetable for the various days of the year when the railway is likely to be open for business. The times of trains running would

always be after the highway network morning peak with trains continuing to run towards the end of the evening peak period for the highway network. The current planned days of operation of the KESR in 2011, as available on their website, has been assumed to apply to the future operation of the RVR.

The daily timetable and days of operation of the RVR are at this very preliminary stage uncertain and thus subject to change. Consequently some assumptions have been made for the purposes of this study to assess the impact of level crossing closures. It has been assumed that 7 trains a day will run, as per the timetable set out in **Appendix D**, during the summer months according to the KESR schedule of days of operation. This will also be the case on a Sunday in the spring and autumn and on Bank Holidays. On a weekday and a Saturday in spring or autumn 5 trains are assumed to run. For the purposes of the traffic analysis spring/autumn months are assumed to be March to June and September and October. Summer months are assumed to be July and August.

## 2.3 Traffic and Queuing Analysis

To assess the impact of level crossing closures on the A21 the traffic situation on a range of "typical" days over the year has been assessed for the A21. These are :

- Spring/Autumn – Average weekday (Monday to Friday)
- Spring/Autumn – Average Saturday
- Spring/Autumn – Average Sunday
- Summer – Average weekday (Monday to Friday)
- Summer – Average Saturday
- Summer – Average Sunday

The daily traffic flow profile of hourly flows over the course of an "average weekday" in the spring/autumn period was calculated by averaging the hourly flows on all weekdays in March to June. Daily flow profiles for the other day types were calculated in a similar manner.

In addition two "non typical" days have been assessed, these being

- May Day Bank Holiday Monday
- August Bank Holiday Monday

The traffic data for the A21 is the most comprehensive data set available of the three sites as it covers the whole of 2010. May Day was chosen as it represents a worst case in terms of the highest recorded hourly traffic flows. Inspection of the A21 traffic data showed that hourly southbound flows in the morning and northbound in the late afternoon/evening period were significantly higher than at other times of the year. Hourly flows on August Bank Holiday were also higher during certain times of the day than other days in the summer.

The available traffic flow data for the B2244 is more limited than that for the A21, with no data available for September or October. Consequently the traffic analysis for average days does not include autumn data.

The data available for the C18 Northbridge Street is even more limited than for the B2244, with only one days worth of data available from September 2010 and also from one day in 2008. Given the type of road and its local function it is considered that flows on this road would not exhibit significant seasonal variation and weekday flows are likely to be higher than Saturday or Sunday flows. Although the B2244 differs from the C18 in many respects it is more local in nature than the A21. In lieu of anything better data for the C18, 12 hour flows on the B2244 have been analysed to provide an indication of daily and seasonal variation on

the C18. This showed very little variation and therefore only a single day type, a weekday in the spring was assessed for the C18.

The RVR advised that the anticipated timescale for completion of the extension to the railway line was likely to be 5 to 10 years. The assessment of the impact of the level crossings has therefore been considered in 2010, the base year, for which traffic data is available and 2016 and 2021. Traffic growth rates for these years have been obtained by reference to the TEMPRO database version 6.2, dataset 62, National Transport Model (NTM) factors (NTM AF09 Dataset) applied for "Rural Minor" and "Rural Principal" Roads. TEMPRO includes both local planning data forecasts and traffic growth forecasts from the NTM. Traffic growth forecasts for the A21 have been derived from the TEMPRO database for growth in East Sussex on the trunk road network and for the C18 Northbridge Street and B2244 Junction Road from forecast for minor roads in the Rother district.

A spreadsheet model has been built to assess the traffic impact resulting from barrier closures at the level crossings. Inputs to the model include:

- Times of closure of the barrier based on the draft RVR timetable;
- Duration of each closure – assumed to be 51 seconds based on the information provided by ORR/HMIR, see **Appendix B**;
- Hourly flows for 2010, in vehicles per minute, at times of barrier closure for each of the average day types and Bank Holidays referred to above for the spring/autumn and summer periods;
- The assumed rate of flow over the crossing after the barrier has been raised, assumed to be one vehicle every 2 seconds or 30 vehicles per minute, based on previous experience.
- Traffic growth rates derived from TEMPRO for 2010 to 2016 and 2010 to 2021.

The model outputs the maximum and average queue lengths in vehicles at the time when the barrier opens to traffic.

A sensitivity test was undertaken to assess the effect of an increased crossing closure time of 112 seconds in certain circumstances, as requested by the ORR/HMIR. The model was re-run for certain day types in 2021 with this increased closure time.

# 3. Existing Conditions

## 3.1 Introduction

In this section the highway network in the immediate vicinity of the proposed level crossings is described. The existing traffic flow conditions against which the operation of level crossings are assessed, are outlined for the relevant day types being considered at each of the three crossing locations. The road safety record at each location is reviewed, based on accident data received from Sussex police.

## 3.2 C18 Northbridge Street

### 3.2.1 Road network

Northbridge Street, see **Photos 3.1 and 3.2**, is the northern route into the village of Robertsbridge from the A21 Robertsbridge bypass and is the western arm of the roundabout on the A21. The proposed level crossing location lies approximately 300m south west of the roundabout. The carriageway is about 7.5 m wide at the crossing, narrowing to about 5.5 m further south towards the village centre. There is a footway on the north west side of Northbridge Street from the roundabout to the village centre, on the south/east side of the road there are intermittent sections of footway. The road is lit and the speed limit is 30mph in the vicinity of the crossing which changes to 40mph on the approach to the roundabout, just to the west of the give way-line. To the south of the crossing point Northbridge Street is on a straight alignment and to the north curves to the east to meet the A21 at the roundabout.

Photo 3.1: C18 Northbridge Street looking towards Robertsbridge

Photo 3.2: C18 Northbridge Street looking towards A21

### 3.2.2 Traffic

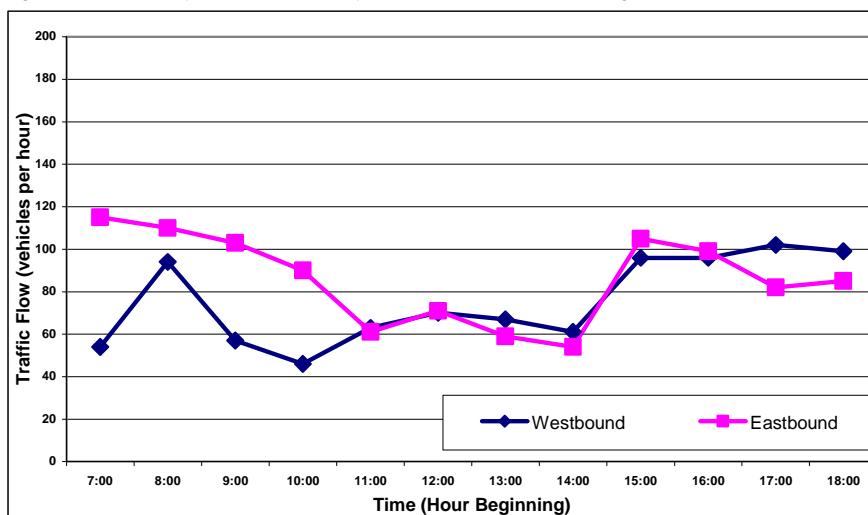

Limited traffic flow information is available for Northbridge Street with data available for only one day in 2010, Tuesday 14<sup>th</sup> September. The data comes from a 12 hour classified count undertaken by East Sussex County Council on all arms of the A21 roundabout.

The 12 hour flows recorded were 905 vehicles per day (vpd) westbound and 1034 vpd eastbound (ie away from the village towards the A21 roundabout); a similar one day count undertaken on Thursday 19<sup>th</sup> October 2008 recorded 771 vpd westbound and 1134 vpd eastbound over this period. The daily flow profile of hourly flows from the 2010 count over the 12 hour day is illustrated in **Figure 3.1**. The graph

shows that the maximum hourly flow was 115 vph travelling eastbound towards the roundabout, between 07:00 and 8:00, well before the start of the trains running on the RVR. During the day, traffic flows did not exceed 100 vph in each direction. In 2008 the maximum hourly flow was 142 vph between 08:00 and 09:00 but the hourly flow during the remainder of the day was generally less than 100 vph.

Given that there is only one day's worth of data available for the C18 Northbridge Street site, 12 hour flows from the B2244 traffic survey site were analysed to identify any variation in flow between spring/autumn and summer periods or between weekdays and other days that could reasonably be applied to the C18 flows. Negligible variation was found and therefore only one daily profile is presented for the C18 Northbridge Street crossing, as shown in **Figure 3.1**.

Figure 3.1: Daily profile of hourly flows on C18 Northbridge Street (14/9/2010)

Source: Traffic survey by East Sussex CC

### 3.2.3 Road safety record

According to the records of Sussex Police, no personal injury accidents have been recorded in the vicinity of the crossing over a five year period up to 30<sup>th</sup> November 2010.

## 3.3 A21 Robertsbridge bypass

### 3.3.1 Road network

The proposed position of the level crossing lies approximately 140 metres south of the roundabout at the junction of the A21 Robertsbridge bypass with Northbridge Street and Church Road, see **Figure 1.1**. At this point the single carriageway road is 7.3m wide with no footways, see **Photos 3.3 and 3.4**. On the southbound approach to the roundabout there is a Toucan crossing, see **Photo 3.5**.

Photo 3.3: A21 Robertsbridge bypass looking north from proposed crossing location

Photo 3.4: A21 Robertsbridge bypass looking south from proposed crossing location

Photo 3.5: Looking north to Pedestrian/cycle crossing on southbound approach to roundabout on A21

The A21 south of the roundabout is subject to the national speed limit and reduces to 40mph on approaching the roundabout, 160m south of the level crossing.

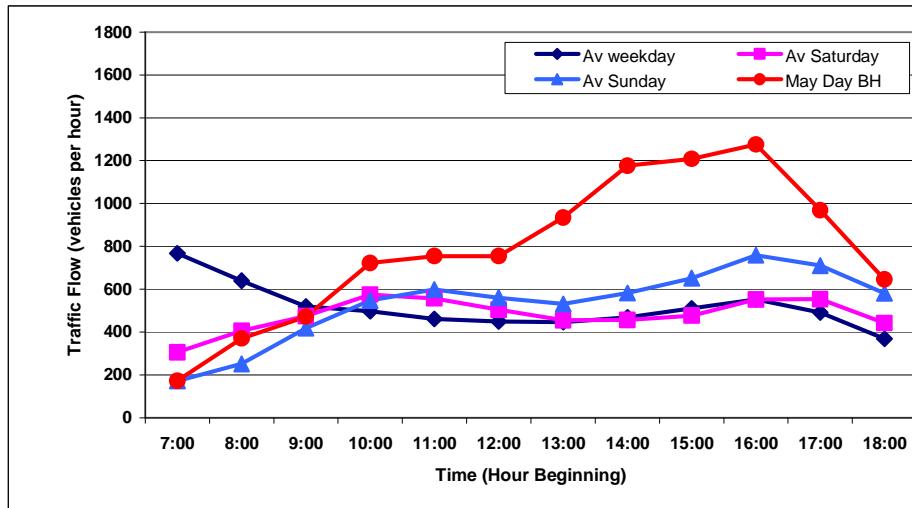

### 3.3.2 Traffic

Extensive traffic flow information is available for the A21 on the Highways Agency TRADS 2 website. As noted in **Section 2.3** data from the whole of 2010 has been obtained in each direction from a site on the A21 Robertsbridge bypass just south of the proposed crossing. The data has been analysed to establish a typical daily profile in each direction for a weekday, Saturday and Sunday in 2010 for both the spring/autumn and summer periods as well as for the early May Bank Holiday and August Bank Holiday.

## Spring/Autumn

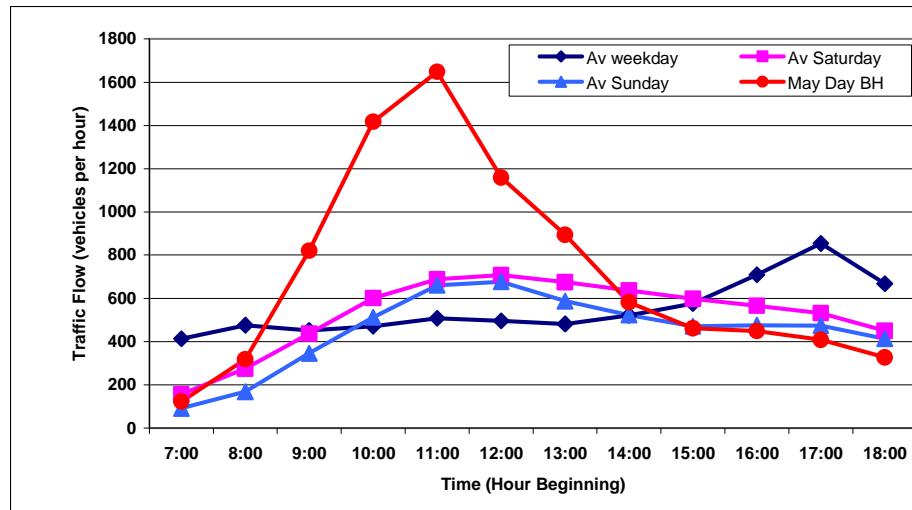

The profiles for the spring/autumn period are shown in **Figure 3.2** and **3.3**.

Figure 3.2: A21 Northbound Daily Profiles Spring/Autumn 2010

Source: <http://trads.hatris.co.uk/>

Figure 3.3: A21 Southbound Daily Profiles Spring/Autumn 2010

Source: <http://trads.hatris.co.uk/>

The daily profiles for an average weekday illustrate the use of the A21 for commuting with a peak northbound flow of just under 800 vph in the morning peak period dropping to around 400-500 vph throughout the rest of the day. In the southbound direction the traffic peaks during the evening commuter peak, with a flat profile of 400-500 vph over the rest of the day.

The profile of flows are fairly similar to each other on a Saturday and Sunday, northbound flows increase gradually throughout the day with a slight peak around 10:00 to 12:00 and a higher peak around 16:00 to

18:00 with the maximum hourly flow reaching about 600 vph on a Saturday and 750 vph on a Sunday. The southbound profiles for a Saturday and Sunday exhibit similar characteristics with traffic gradually rising from less than 200 vph to around 700 vph in the period 11:00 to 13:00 and dropping back to around 400 vph by the end of the day.

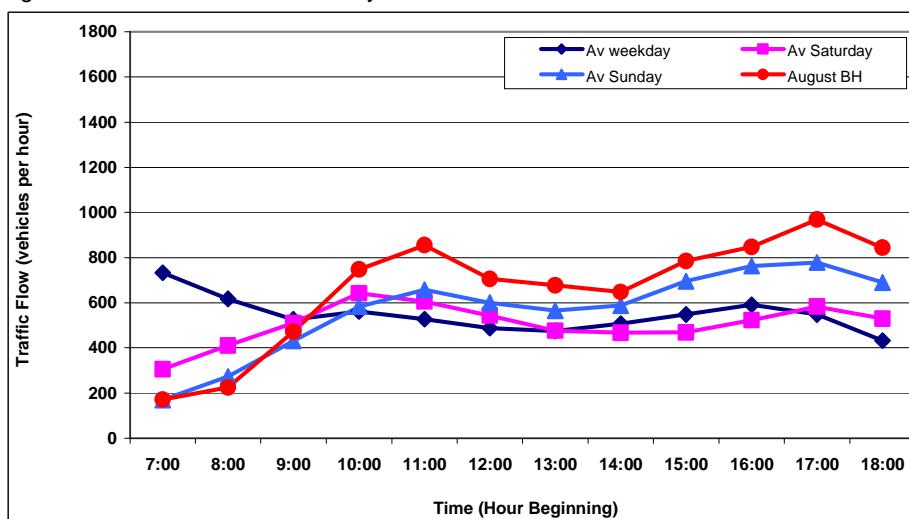

The A21 is single carriageway for a large proportion of its length and it is understood from anecdotal evidence that there is significant congestion at various locations on the A21 at certain times, particularly peak holiday times and Bank Holidays when the south coast becomes a major attraction. The daily profiles of Bank Holiday traffic illustrate the heavy traffic load on the A21 that occurs on such occasions. The southbound traffic on the A21 on the early May Bank Holiday reached a peak of 1649 vph in 2010 and, as can be seen from **Figure 3.3**, traffic flows were significantly higher over much of the day than the "Average" day types. Northbound flows were also relatively high over much of the day during the May Bank Holiday, reaching 1276 vph between 16:00 and 17:00.

### Summer

The profiles of hourly flows over the course of the various day types for the summer period are shown in **Figures 3.4** and **3.5**.

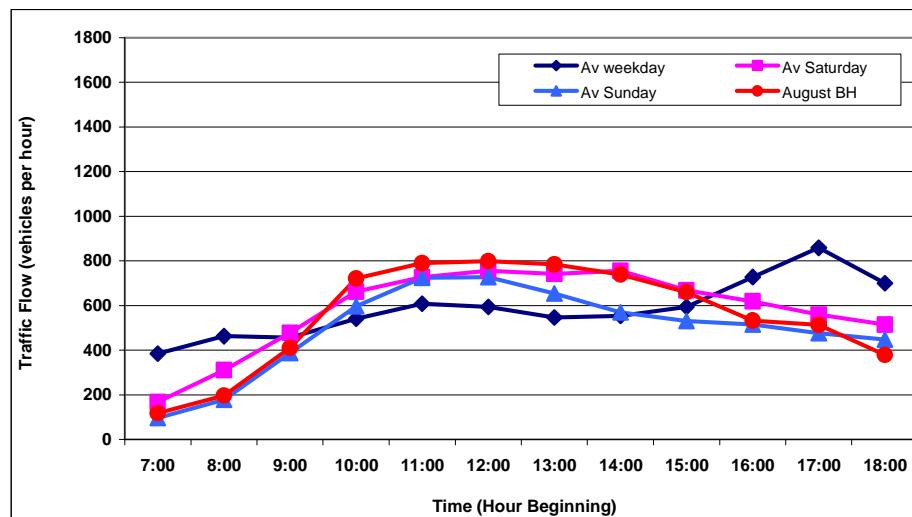

The daily profiles for an average weekday in the summer are broadly similar to those in the spring with a peak northbound flow of just under 800 vph in the morning peak dropping to around 400-600 vph throughout the rest of the day, see **Figure 3.4**. In the southbound direction the traffic rises from around 400 vph at 7:00 to around 600 vph during the interpeak hours rising again to a peak of 700-800 vph in the evening commuting peak hours, see **Figure 3.5**.

Figure 3.4: A21 Northbound Daily Profiles Summer 2010

Source: <http://trads.hatris.co.uk/>

Figure 3.5: A21 Southbound Daily Profiles Summer 2010

Source: <http://trads.hatris.co.uk/>

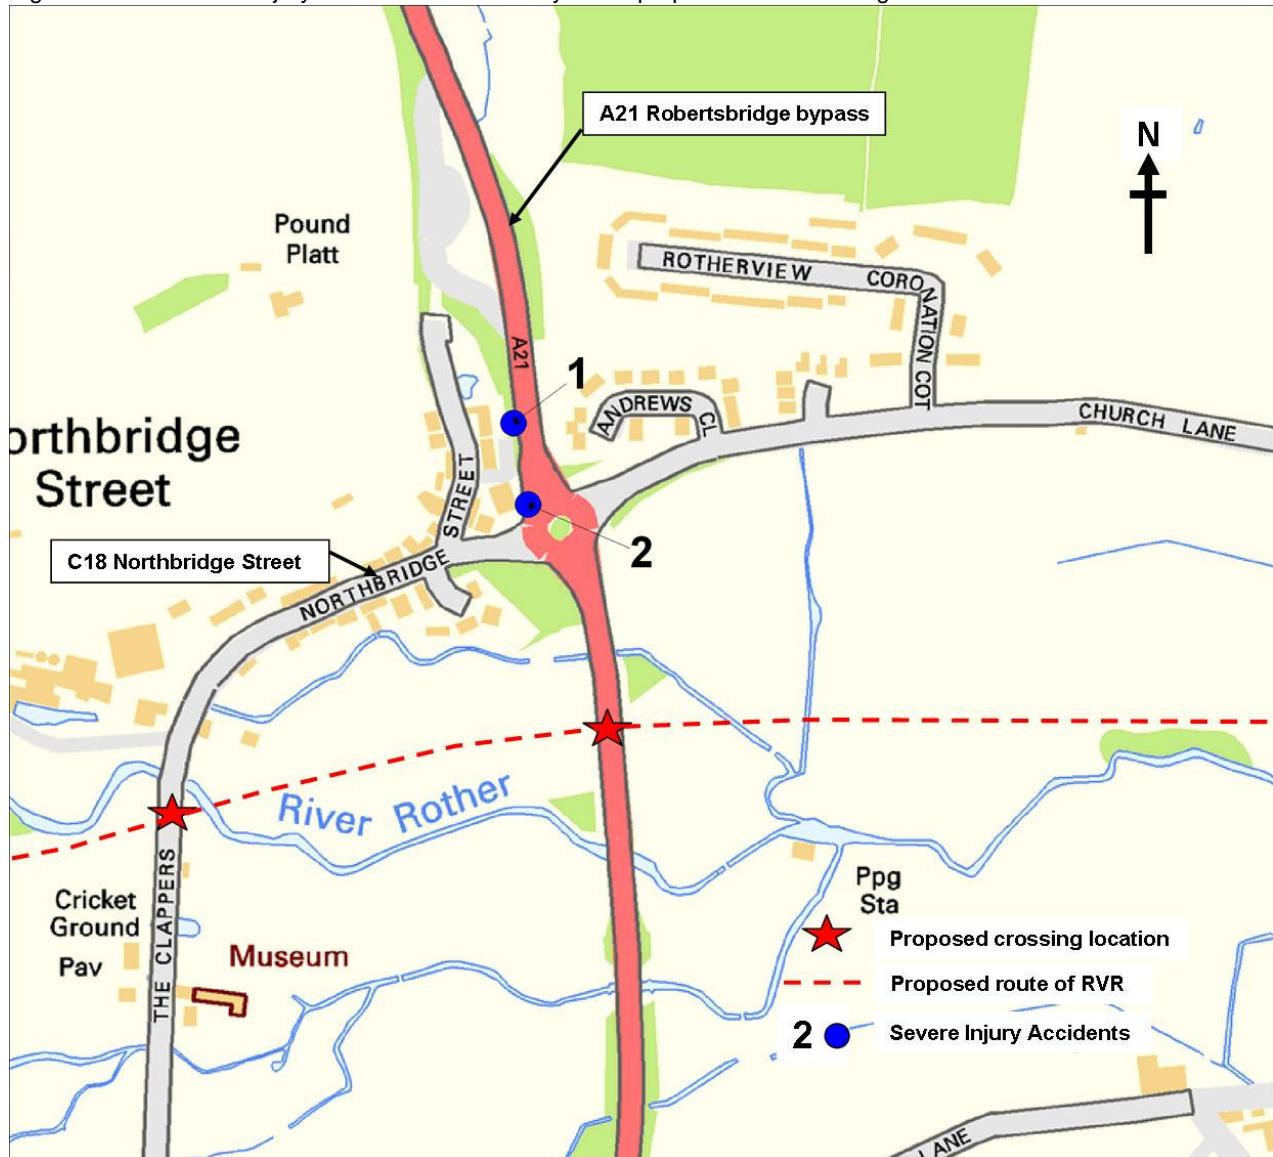

The profile of average hourly flows on a Saturday and Sunday in the summer are very similar to those in the spring, the maximum reaching about 600 vph during mid morning on a Saturday and around 750 vph on a Sunday evening northbound. Southbound profiles are also similar to the spring hourly flow profiles.

Comparing the daily profiles of the May Day Bank Holiday (**Figures 3.2 and 3.3**) with those for the August Bank Holiday (**Figures 3.5 and 3.6**) shows the August profile to be far less peaked than in May. Although in the southbound direction flows on the August Bank Holiday are generally higher, peaking to around 1000 vph between 17:00 and 18:00, those in the southbound direction are only slightly higher than a Saturday or Sunday in the summer, with a maximum of about 800 vph from mid to late morning.

### 3.3.3 Road safety record

Sussex Police records show that two personal injury accidents have been recorded in the vicinity of the crossing over a five year period up to 30<sup>th</sup> November 2010, both of which resulted in serious injury. The two accidents occurred on the A21 approaches to the roundabout 140m north of the proposed level crossing location and both resulted in serious injury to a motorcyclist. The locations of the two accidents are shown in **Figure 3.6**. One of these (No 1) involved only the motorcycle which malfunctioned and caused the rider, who was travelling northbound, to collide with railings on the north side of the roundabout. The other accident (No 2) involved a motorcycle trying to overtake a car that was indicating to turn right resulting in the motorcycle colliding with the car and subsequently a hedge.

Figure 3.6: Personal injury accidents in the vicinity of the proposed level crossing on the A21

Source: Background Mapping - Ordnance Survey data © Crown copyright and database right 2011. Accident locations-Sussex Police

Neither accident could reasonably be attributed to anything associated with the highway layout at the position of the proposed level crossing, given they both occurred at the roundabout. Two accidents in a period of 5 years would not be a sufficient number for the highway authority to consider accident investigations and possible mitigation measures at this location.

### 3.4 B2244 Junction Road

#### 3.4.1 Road Network

The B2244, Junction Road, is a former military road running approximately north/south between the A229 just south of Hawkhurst joining the A21 just north of Kent Street. The road is characterised by slight

gradients and long straights passing through open countryside. The carriageway at the proposed crossing location is about 5 m wide with no footways and solid white edge lines, see **Photos 3.6 and 3.7**.

Photo 3.6: B2244 Junction Road looking north from proposed crossing location

Photo 3.7: B2244 Junction Road looking south from proposed crossing location

On the B2244 the national speed limit applies and to the immediate north and south of the crossing location there are width restrictions in the area of the crossing because of narrow bridges either side of the crossing. Warning signs indicating "Road Narrows, Narrow Bridge" have been installed on the approaches to the two bridges with "Slow" road markings also provided, see **Photo 3.6**.

To the north of the proposed crossing, the road curves slightly to the west after the bridge narrowing, that restricts visibility. Modification works to the entrance to Udiam Farm House have now been completed resulting in relocation further south to suit the proposed railway level crossing as shown on the layout shown on drawing No NBS-LC-01 Rev A included in **Appendix A**, thereby improving visibility to the north. A speed survey would be necessary to establish the appropriate visibility, but it would appear from brief site observations that a visibility splay of 4.5m x up to 215m may be required. The proposed layout of the new access in relation to any re-location of the access would need to be discussed with the highway authority.

### 3.4.2 Traffic

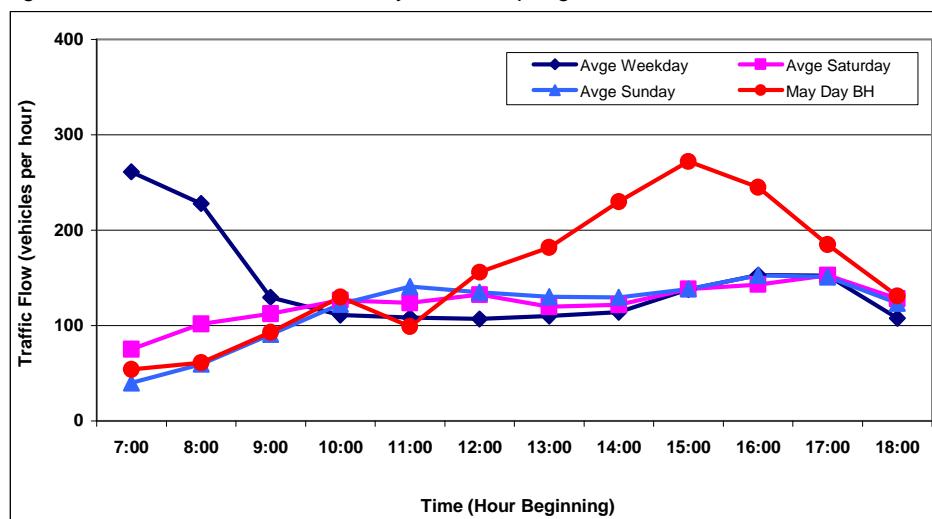

East Sussex County Council has provided ATC data from a site on the B2244 at Cripps Corner, just over 3 km south of the proposed crossing location. This data is taken to be appropriate for this assessment given there are few properties and no side roads between the crossing site and Cripps Corner. Data has been made available for the majority of the spring and summer months in 2010. As for the A21 the data has been analysed to establish a typical daily profile in each direction for a weekday, Saturday and Sunday in 2010 representing both the spring/autumn and summer periods as well as for the early May Bank Holiday and August Bank Holiday.

The northbound and southbound typical day and daily profiles of hourly flows in the spring/autumn months are shown in **Figures 3.7 and 3.8**, respectively. Similarly those for the summer months are shown in **Figures 3.9 and 3.10**.

The graphs show there is little to choose between the daily profiles in the spring/autumn and summer periods for an average weekday, Saturday or Sunday. The profiles for an average weekday show a definite commuter peak of 200-250 vph northbound between 07:00 and 09:00 and southbound of around 300 vph between 1700 and 1800. During the interpeak hours the flows are generally of the order of 100 - 150 vph. On a Saturday or Sunday the flow profile is fairly flat with no pronounced peaking. Flows are about 100-150 vph with southbound flows in the spring/autumn period rising to 200 vph between 12:00 and 13:00.

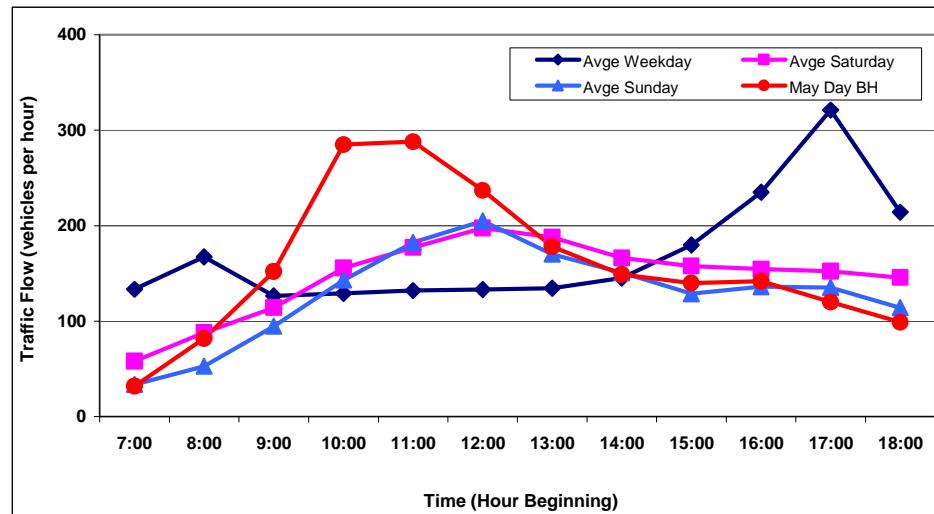

May Day Bank Holiday traffic exhibits a similar shaped daily profile to the A21, albeit with lower flows, with a pronounced peak of about 300 vph southbound between 10:00 and 12:00 and a less severe peaking northbound between 16:00 and 18:00 of about 200 vph. As for the A21 traffic, August Bank Holiday traffic is not as high as for the May Day Bank Holiday, although higher than the average days in the summer period. Flows are consistently just less than 250 vph between 11:00 and 15:00 southbound, with northbound flows gradually rising throughout the day from less than 100 vph at 07:00 to just over 200 vph by 16:00.

### 3.4.3 Road safety record

Sussex Police records show that five personal injury accidents have been recorded in the vicinity of the crossing over a five year period up to 30<sup>th</sup> November 2010, two of which resulted in serious injury and three in slight injury. No fatalities were recorded. The locations of the accidents are shown on **Figure 3.11** and the details summarised in Table 3.1.

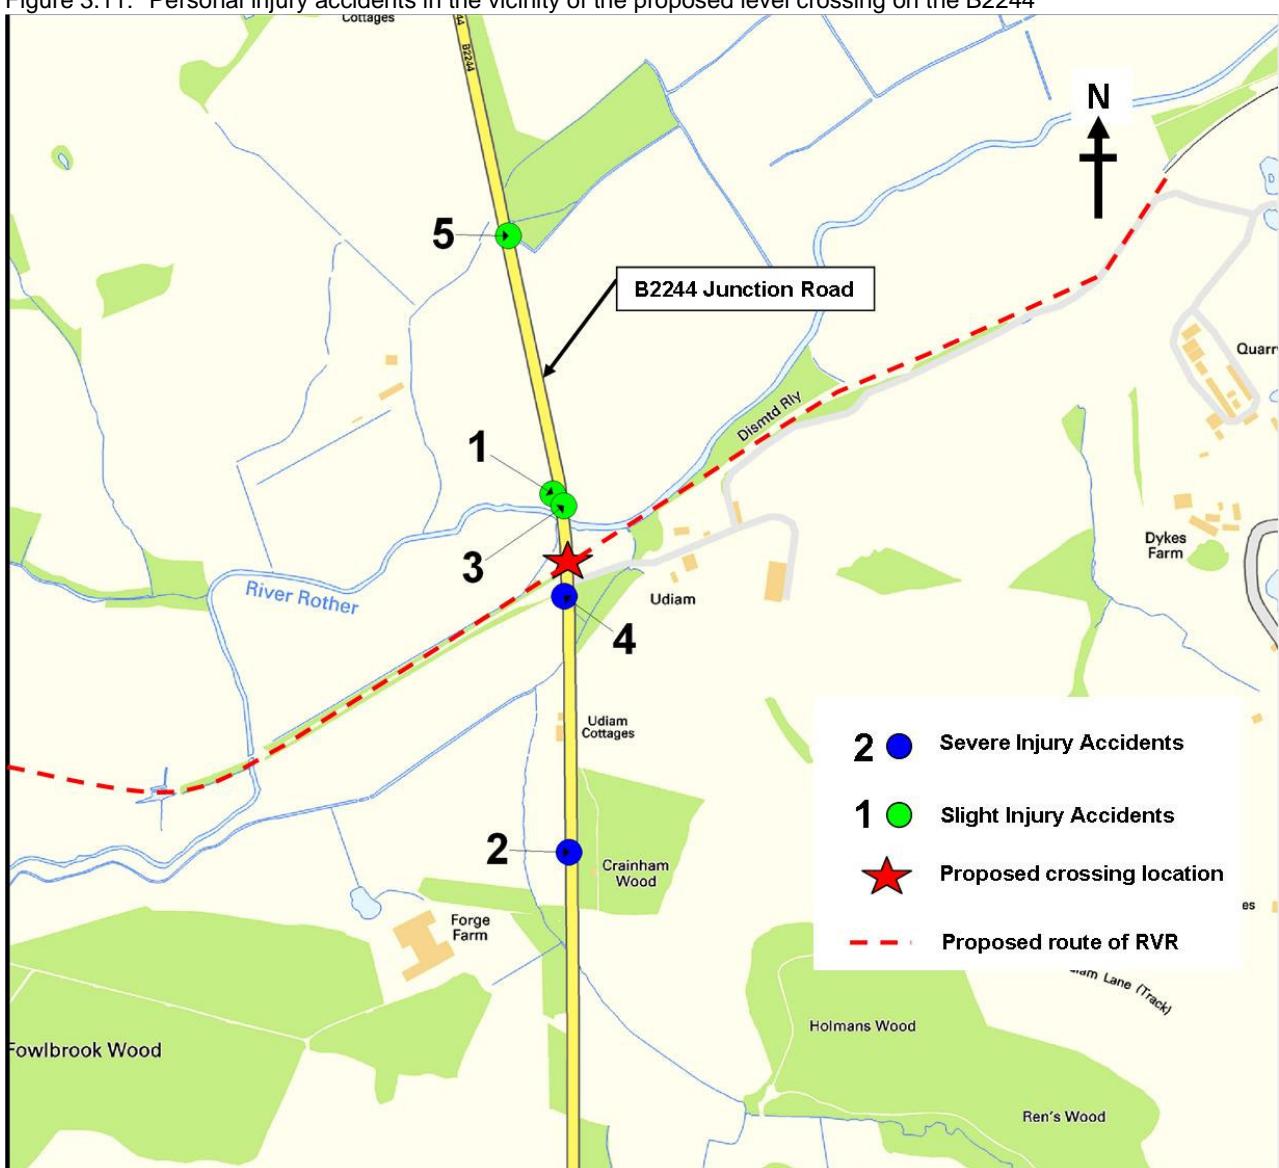

Table 3.1: Accidents on B2244 in the vicinity of the proposed crossing

Ref No (see Fig 3.11)	Severity	Description
1	Slight	A vehicle travelling southbound and on the right hand bend just before the bridge narrowing collided with a concrete post and ended up broadside on the road and would appear to have also collided with a car travelling northbound.
2	Serious	A driver overtaking a group of four vehicles at speed collided with one of the other vehicles, with the overtaking driver and the driver of the lead vehicle in the group of four sustaining serious injuries.
3	Slight	A vehicle was giving way to a vehicle travelling in the opposite direction at the bridge narrowing north of the crossing and a rear end shunt occurred as vehicles joined the back of a queue of two vehicles.
4	Serious	A rear end shunt occurred as a vehicle travelling northbound slowed to give way to a southbound vehicle travelling through one of the bridge narrowings.
5	Slight	A vehicle was travelling southbound and waiting to turn right into a campsite when a second vehicle trying to overtake the first vehicle lost control and left the carriageway.

Source: Sussex Police

It would appear from the accident descriptions provided by Sussex Police that at least four of these accidents were directly related to the speed of traffic on this section of the B2244. The question of speed limits and the potential effect on the road safety record of the level crossing on the B2244 is considered in **Section 4.6**.

## 4. Traffic Assessment

### 4.1 Introduction

The methodology for undertaking the traffic analysis is outlined in **Section 2.3**. In this section of the report traffic growth factors used in the spreadsheet model are set out and the working of the spreadsheet model of queuing behaviour is outlined with model outputs summarised.

### 4.2 Traffic Growth

The anticipated timeframe for opening of the RVR is between 5 and 10 years and therefore traffic forecasts have been produced for 2016 and 2021 using TEMPRO version 6.2 (dataset 62) with NTM factors (NTM AF09 Dataset) applied, as outlined in **Section 2.3**. To calculate growth factors for the A21 and B2244 the planning data for East Sussex has been used in TEMPRO and for the C18 Northbridge Street data for Rother District. The NTM factors for a “Rural Minor” road type have then been applied to the TEMPRO factors for the C18 and B2244 and “Rural Trunk” road type for the A21 to forecast the traffic growth factors.

These traffic growth factors, shown in **Table 4.1**, have been input to the spreadsheet model to forecast the hourly flows in 2016 from the recorded flows in 2010. Similarly factors in **Table 4.2** have been used to forecast 2021 flows.

Table 4.1: TEMPRO/ NTM growth factors : 2010 to 2016

Road Name	Road Type	Average Weekday	Average Saturday	Average Sunday	May Bank Holiday	August Bank Holiday
C18 Northbridge Street	Rural Minor	1.060	1.058	1.057	1.057	1.057
A21 Robertsbridge bypass	Rural Trunk	1.054	1.055	1.054	1.054	1.054

### 4.3 Spreadsheet model of queuing behaviour

To illustrate how the spreadsheet model works an example is shown in **Figure 4.1** for the A21 Northbound situation on a weekday in 2010. Similar outputs have been produced for the A21 and B2244 for each of the different day types in the spring/autumn and summer periods for 2010, 2016 and 2021.

Figure 4.1: Example of spreadsheet model output

											Average queue length	8.0	vehicles
1.170 Traffic Growth factor (2010 to 2021)													

Using the 2010 traffic flow data and the traffic growth factors from TEMPRO a set of forecasts of traffic queue propagations has been produced for the three level crossing locations. The analysis for the A21 has identified where a traffic queue at the closed level crossing has the potential to block the upstream roundabout, 140m to the north of the crossing.

For each barrier closure throughout the day, derived from the preliminary timetable, calculations have been undertaken for each day type in both spring/autumn and summer periods for each year – 2010, 2016 and 2021.

The analysis assumes that the traffic volume in the particular hour that any closure occurs would arrive at the level crossing at a uniform rate, for example 9.69 vehicles per minute (vpm) when the barrier closes at 10:35, see **Figure 4.1**. During the forecast barrier closure period of 51 seconds (0.85 mins) a queue would form at this arrival rate and the predicted queue when the barrier opens again would be 8.2 vehicles, which would be rounded up to 9 vehicles.

As soon as the barriers are raised traffic will cross the railway line at a saturation flow rate (S vpm) which depends upon the characteristics of the road, such as its width and the influence of local junctions. If the level crossings already existed this could be measured but for the purposes of this study it has been assumed to be 30 vpm, based on experience elsewhere.

Thus a queue formed at 9.69 vpm will dissipate at a rate of 30 vpm minus 7.69vpm = 20.31 vpm. As in this case the time until the next barrier closure is 44 mins 15 seconds (Column 11 in Figure 4.1) the queue of 9 vehicles would obviously dissipate well before the next barrier closure.

#### **4.4 Forecasts of queue lengths**

The average and maximum queue lengths, in metres, predicted by the model for the C18 Northbridge Street are set out in **Table 4.3**. Similar results for the A21 and B2244 Junction Road are included in **Table 4.4** and **Table 4.5**, respectively. A vehicle is assumed, on average, to occupy 5.75m; a widely used figure in traffic modelling.

Sunday	13	11	16	13	14	12	17	14	15	12	18	15
Aug BH	18	12	19	16	19	13	20	17	20	14	21	18

Note: All queue lengths are in metres (rounded up to the nearest whole metre), assuming each vehicle in a queue occupies 5.75m on average

The results for the Northbridge Street crossing predict that there would be minimal queuing of one or two vehicles at each crossing closure, up to 2021. At the B2244 Junction Road crossing maximum queue lengths of 17 - 29 m are estimated to be reached by 2021 on a weekday in the summer.

As expected, given the significantly higher levels of traffic than on the other two roads, queues at the A21 crossing would be more extensive. The critical queue is southbound because the roundabout at the junction of the A21 with Northbridge Street lies 140m north of the proposed crossing location, representing a queue storage capacity of approximately 24 vehicles. The model predicts that queue lengths would not extend back to the roundabout on any day up to 2021 with the exception of May Bank Holiday Mondays. By 2016 the southbound maximum queue would on average be just over 140m long and reach a maximum of 1.2 km by 2021. This assumes that the level of traffic experienced in 2010 on the May Bank Holiday is typical for that day and this would increase up to 2021 in line with the traffic growth forecasts estimated using TEMPRO/NTM.

It should be borne in mind that although the proposed level crossings would impact on the free flow of traffic level crossing this would not occur every day. The 2011 schedule of days of operation of the KESR indicates that trains will run on 181 days of the year, ie approximately 50%. As noted previously the RVR would run to a similar schedule. A detailed breakdown of the days of operation is shown in **Table 4.6**.

Table 4.6: Summary of days of railway operation in 2011

Day type	No of days railway operates	% of total days in year
Weekdays	99	39%
Saturdays	38	73%
Sundays	39	75%
Public Holidays	5	63%
All days	181	50%

Source: KESR Schedule for 2011

## 4.5 Review of Traffic Impact

### 4.5.1 C18 Northbridge Street

The traffic flow forecasts input to the spreadsheet modelling indicate that there will not be a queuing problem at Northbridge Street up to 2021 and probably beyond. Queue lengths are predicted to be a maximum of two vehicles which are insignificant.

### 4.5.2 A21 Robertsbridge bypass

Not surprisingly, queues are predicted to be a lot higher on the A21. However, with the exception of the early May Bank Holiday predicted queues in 2021 would be at most around 12 vehicles long southbound. There would therefore be no adverse effect on the roundabout to the north, given there is capacity for 24 vehicles to queue between the crossing and the roundabout.

At an early stage in this study, prior to the analysis being undertaken, the possible need for traffic management measures in the vicinity of the A21 roundabout was considered. It was felt at that time that at busy times vehicles travelling southbound on the A21 may lock up the roundabout, delaying or preventing

traffic from exiting Northbridge Street or Church Lane. Two options were discussed with the client:

- Yellow box markings on the circulating carriageway of the roundabout;
- Linking the Toucan crossing north of the roundabout to the level crossing signal.

The analysis has shown that there would be very limited benefit resulting from either of these measures given that the queue of traffic southbound at the level crossing would only extend back to the roundabout on a very few days of the year. Furthermore, in the case of the signals option it is considered that there would be a road safety issue if the two sets of signals were linked signals. Drivers approaching the Toucan crossing would become frustrated if the signal were to be on red for traffic and green for pedestrians/cyclists with none using the crossing. Drivers may well then ignore the signal, particularly if they were already being held up in the general level of congestion on the A21 such as during the spring Bank Holiday.

It is understood that long queues currently occur on occasions on the A21, particularly at Bank Holidays, and this would occur in the future irrespective of whether or not a level crossing was present. The level crossing barriers being lowered to stop vehicles for 51 seconds would have no discernible effect on the overall journey time of the vast majority of motorists, given they would be in a queue anyway and would merely be held up for a short time before then having to join the back of the queue again downstream of the crossing.

#### **4.5.3 B2244**

The model results indicate there will not be a queuing problem at Junction Road (B2244) up to 2021 and probably beyond. Queue lengths are predicted to be a maximum of five vehicles.

### **4.6 Effect of increasing duration of crossing closure**

On the advice of the ORR/HMIR, see **Appendix B**, it has been assumed that the normal duration of any closure of the crossing would be 51 seconds. In some instances it may be necessary to close the barrier for a longer period and thus a sensitivity test has been undertaken to establish queue lengths resulting from a 112 second closure, also suggested by the ORR/ HMIR. As outlined in **Section 4.4**, the May Bank Holiday represents the day in 2010 with the highest traffic flows on the A21 and B2244 and thus sensitivity tests for a May Bank Holiday in 2021 with 112 second closures has been undertaken for these two crossings. The C18 Northbridge Street has been assessed for a weekday in 2021 in the Spring/Autumn period, the only day type for which 2010 traffic data was available. The results are shown in **Table 4.7**.

Table 4.7: 2021 Queue lengths resulting from 112 second duration crossing closure

Location	Day Type	Closure Time (secs)	Northbound		Southbound	
			Maximum Queue (m)	Average Queue (m)	Maximum Queue (m)	Average Queue (m)
C18 Northbridge Street	Spring/Autumn Weekday	51	12	6	12	6
C18 Northbridge Street	Spring/Autumn Weekday	112	23	17	23	17
A21 Robertsbridge bypass	May Bank Holiday	51	121	93	1217	196
A21 Robertsbridge bypass	May Bank Holiday	112	265	205	1721	389
B2244 Junction Road	May Bank Holiday	51	25	18	27	17
B2244 Junction Road	May Bank Holiday	112	55	39	58	38

As can be seen from the results in **Table 4.7**, increasing the closure time from 51 to 112 seconds would have some impact on the queue lengths at the Northbridge Street and Junction Road crossings, although not sufficient to cause significant delays. In the case of the A21 the effect on queue lengths is more marked but, as noted in **Section 4.5.2**, the presence of the crossing would have little noticeable effect on overall journey times, given the significant congestion that currently occurs on the A21 particularly at Bank Holidays.

## 4.7 Speed Limits

### 4.7.1 C18 Northbridge Street

The proposed crossing location is in a 30mph speed limited area with a good road safety record and therefore the speed limit and its extent should remain unchanged with the introduction of a level crossing.

### 4.7.2 A21

The level crossing at the A21 location would necessitate extending the existing 40 mph speed limit south of the crossing location for road safety reasons as it currently ends about 20m south of the proposed crossing location where it reverts to the national speed limit. The Design Manual for Roads and Bridges (DMRB) recommends safe stopping distances for roads of this type and accordingly it is proposed that the speed limit should change from 40mph to the national speed limit at least 215 m south of the proposed level crossing position. This would allow sufficient distance for a vehicle travelling at 70mph to stop before the crossing when it is closed.

The exact position of the change in speed limit and the appropriate signing will be determined at the detailed design stage in consultation with the Highways Agency, in light of the results of a speed survey. The topography in the locality and appropriate cutting back of vegetation would provide clear visibility for motorists of the level crossing and approaching trains of up to 250m, in addition to the warning signs and signals associated with the crossing.

#### 4.7.3 B2244 Junction Road

The road safety record at this crossing location has been examined, as discussed in **Section 3.4.3**. The review of the accident records clearly indicates excessive speed being a problem, compounded by the highway layout. This is evidenced by the warning signs and markings on the approach to road narrowing at two bridges close to the proposed crossing location.

The number of barrier closures is relatively infrequent and only occur on 50% of the days of the year. However a level crossing at this location may well prove to be beneficial in terms of traffic calming, subject to the necessary warning signs being provided and an appropriate speed limit on the approaches. The presence of signs indicating a crossing ahead would tend to make drivers reduce vehicle speeds even when the barriers are not down.

It is suggested at this stage that a 40mph speed limit would be appropriate and this should extend for a distance of at least 215 m either side of the crossing location, the safe stopping distance for a road such as the B2244 which is currently subject to the national speed limit. The local highway authority, East Sussex County Council, will need to be consulted regarding the introduction of any new speed limit and how far it should extend either side of the crossing to enable the safe operation of the level crossing at this location, taking account of the road safety record.

#### 4.8 Potential for central reserve barrier at A21 crossing

The ORR/HMIR has expressed concern that drivers may seek to “weave round” the barriers as they are closing. There is the potential for this to happen given the barrier on each side of the crossing would be in two sections such that the nearside and offside would lower independently.

The sequence of operation of the barrier lowering in terms of road traffic is:

- Stage 1 – The two barriers on the nearside to approaching road traffic are lowered simultaneously;
- Stage 2 - One second after completion of Stage 1 the offside barriers on each approach are lowered simultaneously
- Stage 3 – All four barriers are raised simultaneously once the train has cleared the crossing

In order to prevent “weaving around” the barriers a solid central reserve traffic island could be installed on the northbound and southbound approaches to the level crossing for a distance of 50m either side of a crossing. This would deter abuse of the crossing by all but the most determined of drivers.

The existing carriageway comprises two running lanes of 3.65m standard width and a 1m hard edge strip. The installation of a solid central reserve island would require widening the carriageway by at least 2.7m to create a single lane width dual carriageway section with a 1.5m minimum solid central reserve and 4.0m wide running lanes in each direction, the 1.0m edge strip being retained. The engineering feasibility of widening the A21 at this location is beyond the scope of this study and would require detailed investigation.

On the approaches to the solid central island appropriate signs and marking would be required in accordance with the guidance set out in the Design Manual for Roads and Bridges (Volume 6, Section 2, Part 6 TD 42/95).<sup>1</sup>

---

<sup>1</sup> DMRB (Volume 6, Section 2, Part 6 TD 42/95) – Geometric Design of Major/Minor Priority Junctions

Given the location of the roundabout 140m to the north an ideal solution would be to extend the solid central reserve north to combine with the splitter island at the roundabout. However as there is an access gate to a maintenance facility on the west side of the A21 between the crossing and the roundabout, a solid central reserve would be a limitation on the use of that access gate and consequently a hatched central reserve would be appropriate over this relatively short section. It may also be necessary to extend the street lighting south from the roundabout, to include the solid central reserve and the full extent of the northbound approach to it.

The presence of a solid central reserve would reduce vehicle speeds on the approaches to the level crossing, particularly northbound, in addition to minimising the occurrence of "weaving around" the barriers. However these benefits need to be considered against the likelihood of abuse of the crossing. It is considered that abuse is most likely to occur at times of low traffic flow, where a driver can see a clear exit route on the other side of the crossing and the driver believes he may not be seen by other drivers or only a few other drivers. Traffic flows on the A21 at times when the trains are running are at least 400-500 vph in each direction, as illustrated by the graphs in **Figures 3.2, 3.3, 3.4 and 3.5**.

Our advice is that a two stage approach to dealing with this issue is appropriate, the first stage being the installation of CCTV cameras to record any abuse and if this is identified as widespread then the potential for installing a solid central reserve should be investigated further.

## 5. Conclusions and Recommendations

### General

- The Rother District Council is supportive of the proposal to extend the KESR from Bodiam to Robertsbridge. Subject to suitable crossing arrangements at the C18, A21 and B2244.
- Trains would normally run on about 50% of the days of the year with 5 to 7 trains operating per day in both directions. Trains would not start running until after 10:00 and would continue throughout the day with the last train running between 16:00 and 18:00, depending on the day
- The level crossing barrier would normally be lowered for a maximum of 51 seconds, to allow a 115m long train travelling at between 10 and 25 mph to cross each of the three roads. A longer period of 112 seconds has also been considered to allow for the possibility of delays in the train arriving at and travelling through the crossings.
- The anticipated opening year for the railway would be between 2016 and 2021.
- Traffic is forecast to grow by 5-6% between 2010 and 216 and a further 8-11% up to 2021.

### C18 Northbridge Street

- The maximum hourly traffic flow recorded at the C18 Northbridge Street crossing location was 115 vph towards the roundabout based on a single days survey in September 2010. Even allowing for traffic growth to 2021 the maximum queue length at the crossing would be 2 vehicles for a closure times of 51 seconds and 4 vehicles for a 112 second closure time. There are no existing road safety issues apparent at the Northbridge Street crossing location based on examination of accident records for a 5 year period.

### A21 Robertsbridge bypass

- The highest traffic flows on the A21 were recorded on the early May Bank Holiday when southbound traffic flows reached 1649 vph. By 2016 it is forecast that traffic flows on this day would cause extensive queue build up at the crossing during mid morning, assuming that the 2010 early May Bank Holiday was typical. Queues would extend back through the roundabout 140m north of the crossing location.
- The capacity of the A21 was exceeded in 2010 and a flow of 1649 vph would have caused significant congestion anyway on the A21. Barrier closures of 51 and 112 seconds would have no discernible effect on overall journey times in most cases as drivers would be in a queue anyway and would be held up for 51 seconds before then joining the queue downstream of the crossing.
- Traffic management measures to manage the southbound queuing through the A21 roundabout would not be justified given that this level of traffic would only occur on occasional days such as the early May Bank Holiday.
- The road safety record for the A21 shows 2 accidents occurred at the roundabout, unconnected with road or traffic conditions at the location of the proposed crossing.
- The 40 mph speed limit on the A21 south of the roundabout should be extended south by at least 215m, subject to discussions with the Highways Agency.
- A solid central reserve island on each approach to the level crossing would overcome the perceived problem of abuse of the crossing by drivers “weaving around” the barriers as they close. The operation of the crossing should initially be observed by CCTV to monitor the extent, if any, of abuse before considering the implementation of an engineering solution.

## B2244

- Traffic data for the B2244 shows the maximum hourly flow in 2010 to be approximately 250 vph on a weekday and about 280 vph during the May Bank Holiday. This level of traffic would not cause excessive queuing at a crossing, the maximum predicted queue by 2021 would be 5 vehicles, rising to 10 vehicles if the barrier were closed for 112 seconds.
- The B2244 is currently subject to the national speed limit at this location. The existing road safety record in the vicinity of the proposed crossing is a matter of concern given there have been five accidents in a five year period, four of which appear to be related to excessive speed and the highway layout.
- It is recommended that a speed limit of 40mph be introduced either side of the crossing for a distance of 215 m, subject to discussions with the highway authority, East Sussex County Council. The section of 40 mph speed limit and the provision of warning signs for the level crossings on the approaches to them is likely to have a traffic calming effect and may result in an improved road safety record on this section of the B2244.

### **PROPOSED RAILWAY LEVEL CROSSINGS**

at

B2244, 'Junction Road', Udiam  
A21, Robertsbridge Bypass

Unclassified road at Northbridge Street (formerly A21)

*Issue: 12<sup>th</sup> October 2011 (MCH/AS)*

#### **Legislation**

Primary legislation comprises Level Crossings Act 1983, Transport and Works Act 1992, Level Crossings Regulations 1997 and Road Safety Act 2006.

The proposed Level Crossings have been drawn in accordance with current regulations and follow advice received during a visit to the level crossing sites by representatives of the Office Rail Regulator (Her Majesty's Railway Inspectorate) (ORR). The proposals conform to their guidance note 'Level crossings: a guide for managers, designers and operators' - Railway Safety Publication 7, August 2011"

It should be borne in mind that the details of the proposals may be subject to minor changes during the planning process as a result of statutory consultee's responses.

At this stage we are preparing to consult further with ORR and the relevant Highway Authorities, working toward securing outline approval in principle for the three level crossings. This is to meet planning conditions in the Rother District Council Local Plan.

At a later stage a formal application would be made to The Secretary of State through the Office of the Rail Regulator for Level Crossing Orders to be made under the 1983 Act at the three locations.

### **Crossing Operation & Protection:**

Gated crossings would be provided using Lifting Barriers that cover the full width of the carriageway when lowered. Each crossing will have associated signage and carriageway markings in accordance with the Traffic Signs Regulations and General Directions 2002. This type of level crossing is known as an Automatic Barrier Crossing (Locally Monitored) ABC(L)

It is considered that this system offers best practice for safe working with minimal delay to road traffic.

All three level crossings permit vertical road profiles well within the requirements for the safe passage of exceptionally long and/or low vehicles.

### **Brief description of level crossing operation:**

Except when a train needs to cross the barriers are raised and road traffic is free to pass and the warning lights are off. When a train approaches the Level Crossing the sequence of working is:

- a) An approaching train initiates the road protection procedure by ‘striking in’ – either through the activation of a track circuit or the operation of a rail mounted treadle.
- b) Sequential operation of traffic warning lights and barriers then commences. Amber lights show on ‘wig wag’ heads for 3 seconds before alternating red lights start flashing. The barriers shall take not more than 10 seconds from the time they start to lower, to reach the fully lowered position. The train shall arrive at the crossing not less than 27 seconds after the beginning of the closure sequence.
- c) Concurrent with b) a signal light is displayed on the train drivers’ crossing indicator (DCI) and must be approached under caution. The crossing speed shall be indicated by a special speed restriction sign located at a point at which the DCI can be seen and that the crossing itself can be observed to be clear of obstruction.
- d) Once the protection procedure is completed, the DCI displays a flashing white light, when the train may proceed over the crossing.

- e) When the rear of the train clears the exit side of the crossing then the road opening procedure is activated – lights stop flashing and barriers raise, and the road traffic is released.

During the whole sequence the train driver must keep a lookout and be able to Stop if the DCI fails to display a flashing white light, or if the crossing is seen to be obstructed. This is the ‘local monitoring’ and obviates collision with stalled vehicles and danger from vandalism, trespass and equipment malfunction.

### **Timings:**

The estimated total ABC(L) occupation time for a typical Kent & East Sussex Railway passenger trains are as given below;

Normal train lengths are a locomotive and up to five coaches giving a nominal 115 metres overall length.

<b>Train length</b>	<b>Speed 25 mph - Road closure time</b>	<b>Speed 15 mph - Road closure time</b>
115 metres	38 sec	45 sec

It is anticipated that crossing closures (in both directions) per day for regular passenger trains would number from about 10, between 1000 hrs and 1700 hrs during spring and autumn, to about 14 between 1000 hrs and 1830 hrs during the peak summer holiday season.

### **Crossing locations:**

#### **B2244, ‘Junction Road’, Udiam**

**See Accompanying Drawing No. JR – LC - 01 Revision A**

Subject to the national speed limit, this former military road has easy gradients and long straights.

The location allows a flat crossing, skewed at approximately 15 degrees.

The highway at this point is approximately 5 metres wide with no pedestrian footways. The road is constricted in the area of the crossing because of narrow bridges in both directions.

The railway would be reinstated on its historic alignment at this crossing. A level crossing at this location may well have a useful traffic calming effect at this location. A 40mph road speed limit is proposed at the level crossing.

East Sussex County Council is the responsible authority.

**A21, Robertsbridge Bypass**

**See Accompanying Drawing No. A21 – LC - 01 Revision A**

The bypass intersects the alignment of the railway approximately 140 metres south of the Northbridge Street roundabout. At this point the 7.3 metre wide carriageway (single two way, no footways) is raised above the Rother floodplain on an approximately 2 metre high embankment.

The level crossing requires a shallow rising embankment from the original railway formation level to the carriageway with negligible visual impact.

The only realistic option for crossing the A21 is a level crossing.

It is proposed that the existing 40mph road speed limit south of the Northbridge Street roundabout is extended so as to incorporate the Level Crossing location. The rest of the bypass is and shall remain, subject to the national speed limit.

A level crossing would be flat, skewed at approximately 5 degrees and in open country. Local clearance of vegetation would permit views of the railway over a distance of at least 250 metres in each direction, affording road users early visual contact with approaching trains (in addition to level crossing signage)

The Highways Authority is the responsible authority.

**Unclassified road at Northbridge Street (formerly A21)**

**See Accompanying Drawing No. NBS – LC - 01 Revision A**

This is a 30 mph restricted road and now a quiet village street. The location allows a flat crossing at a skew of approximately 25 degrees.

East Sussex County Council is the responsible authority.

## **Precedents**

Some recent level crossings of principal or well used roads by heritage railways are already in operation and others planned, below are typical examples;

### **New Roads**

Cholsey and Wallingford Railway, Oxfordshire. Crossing of A4130, Wallingford Bypass

Dean Forest Railway, Gloucestershire. Crossing of A48, Lydney Bypass

### **Existing Roads**

Welsh Highland Railway, Porthmadog, Gwynedd. Crossing of A487.

North Norfolk Railway, Sheringham, Norfolk. Crossing of 'Station Road'

Cambrian Railway, Oswestry, Shropshire. Crossings of A485 and A5.

### **Kent & East Sussex Railway**

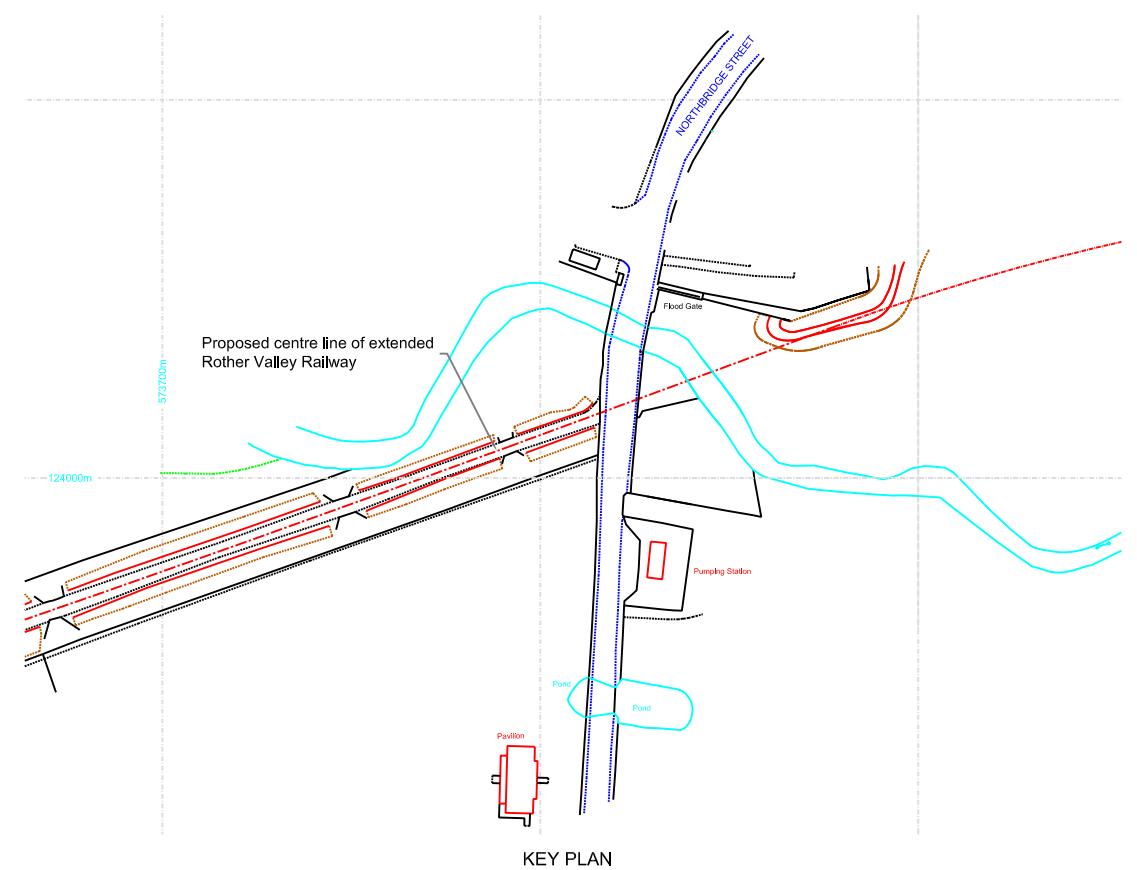

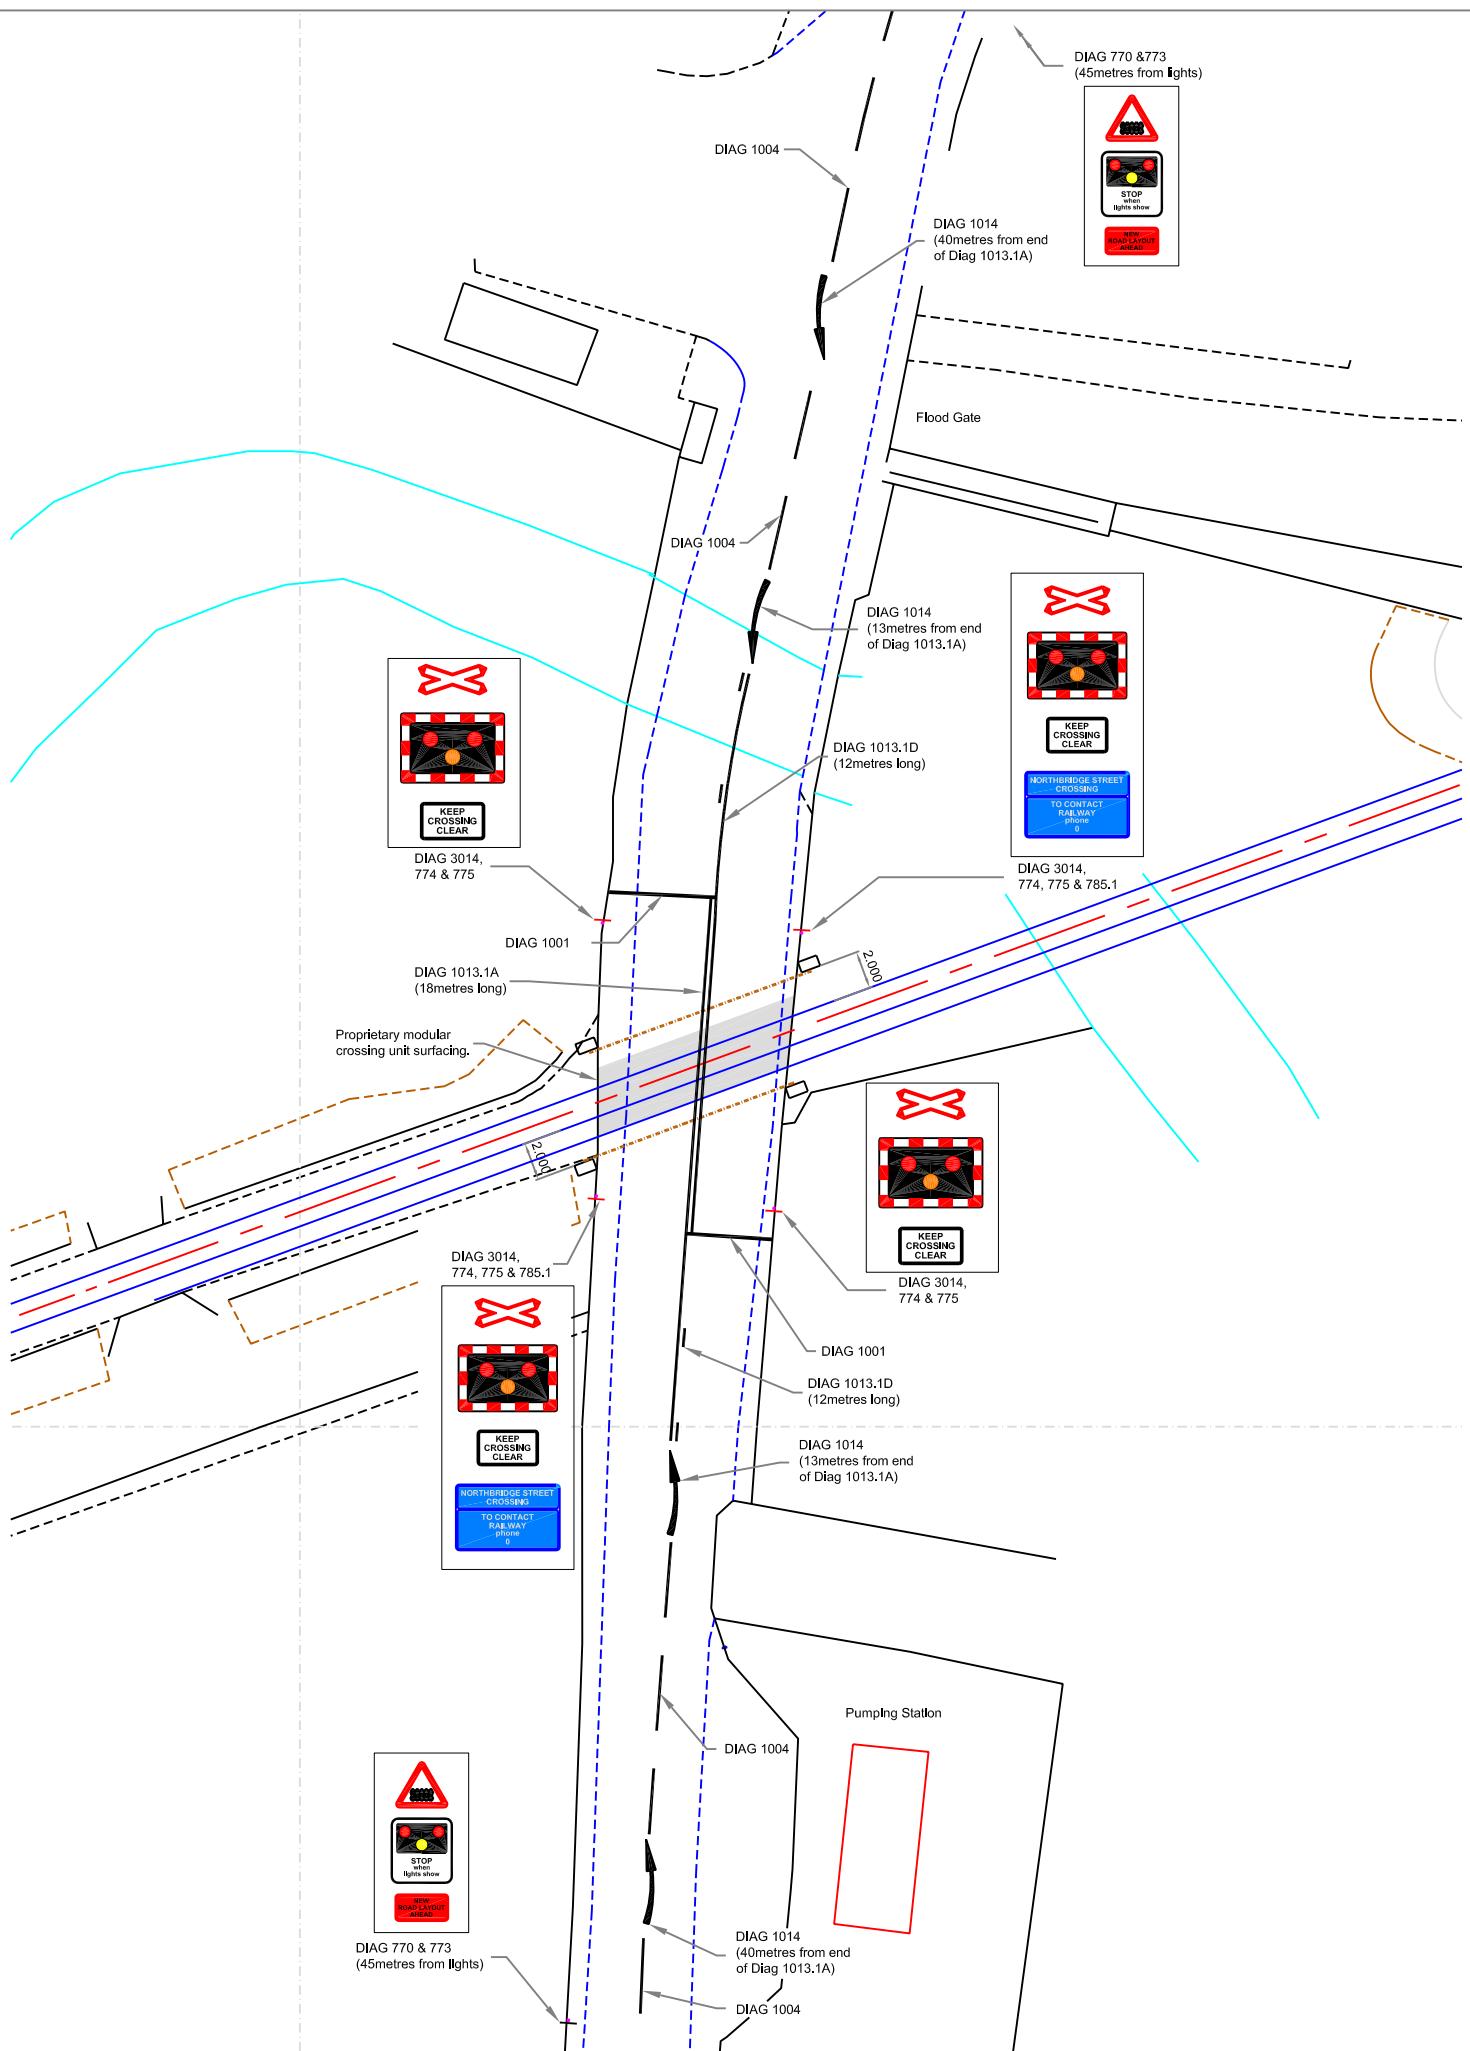

The 10 mile section of line already operating between Tenterden and Bodiam incorporates six traditional gated level crossings including two over the A28.

### **Network Rail Level Crossings**

Numerous examples of automatic level crossings are found in Kent and the county of East Sussex and motorists and other road users will have a greater familiarity with them than perhaps in other parts of the UK. Nearby examples found on the mainline system include the barrier level crossing at Robertsbridge Station Road and the A2100 near Mountfield.

24 August 2011

Mr Mike Hart OBE  
Rother Valley Railway Ltd  
Robertsbridge Station  
Station Road  
Robertsbridge  
East Sussex  
TN32 5DG

Dear Mike

**Extension of Kent & East Sussex Railway: Bodiam to Robertsbridge - Proposed railway level crossings**

Thank you for the letter you sent to David Keay on 19<sup>th</sup> July 2011 along with the various enclosures. Apologies that it has taken me a little while to respond to your submission.

The documents summarise the case well and the technical note from John Sreeves of Halcrow is very helpful.

As Halcrow's note rightly says it remains ORR policy that level crossings should be avoided wherever possible. Having said that, where there is a suitable justification we do not object to their creation if they are shown to present tolerable levels of risk to road and rail users, that the alternatives are not reasonably practicable and their creation is beneficial in a wider sense. Such cases are not uncommon in the reopening of disused railway lines by heritage operators.

The documents supporting your proposal refer in a number of places to ORR and earlier guidance. I should advise you that on 4 August 2011 ORR republished the guidance on level crossings<sup>1</sup>. This has updated the previous RSPG guidance and consolidated into it the guidance on how to obtain level crossing orders. Whilst the guidance has been modernised I do not believe that you will find any substantial change in the principles that are set out.

---

<sup>1</sup> <http://www.rail-reg.gov.uk/server/show/nav.1567>

### Road Closure times

If you do decide to seek a Level Crossings Act Order one of the important considerations that comes into that process is the effect that the road closure time may have on the 'convenience' afforded to road users. The assessment work of Mott MacDonald is important in that respect.

Within the Mott MacDonald assessment of traffic impact they have used a likely crossing closure time of 45 seconds, with some sensitivity analysis to show the effect of a 60 second closure. ORR guidance is that crossings should normally see a train arriving at the crossing within 27 seconds of the crossing sequence commencing, but our guidance accepts that there may be variability and states that 95% of trains should arrive within 75 seconds. The time taken to pass over the crossing is then clearly dependent on train speed and length, and we would assume that the barriers would be fully raised in a maximum of 10 seconds.

Overall I would suggest that the 'worst case' for the analysis should assume 75 seconds for the train to arrive, with 27 seconds being a minimum.

For a 115m long train, it would take around 11 seconds to pass over the width of a 7 metre wide road crossing at 25 mph, or 27 seconds at 10 mph.

There would then be a minimum of 4 seconds and a maximum of 10 seconds for the barriers to rise.

Theoretical road closure time is therefore a minimum of  $27 + 11 + 4 = 42$  seconds and a maximum of  $75 + 27 + 10 = 112$  seconds. A normal figure is likely to lie between these extremes, with arrival times of 30 seconds, crossing of 15 seconds and barrier raising of 6 seconds, a total of 51 seconds.

I believe that the Mott MacDonald analysis should consider a slightly longer normal figure than 45 seconds, and that their sensitivity analysis should extend to the extreme 112 second case.

### Crossing Layout

Our republished guidance does refer to the importance of sighting for crossings where the train driver has to establish that the crossing is clear as they approach. It appears that the relatively straight alignment of the proposed extension is favourable in this respect and train drivers should be able to see any standing obstructions on the crossings in plenty of time to allow them to brake to a stand.

For the A21 crossing I have would like you to consider whether the provision of a length of central reserve island on either side to the crossing would help to deter motorists from 'weaving round' the barriers. This type of crossing abuse by motorists is all too common and the need for this or other measures to discourage abuse should be considered.

### Level Crossing Equipment

Much of the cost of crossings can come from the specialised control equipment that so often seems to be deemed necessary for such cases.

Given the mitigations that exist by the slower speed of operation of the railway you might consider that systems to normal railway signalling levels of integrity may not be required and instead systems that operate to the levels expected of road traffic signal controllers may be perfectly acceptable. For example ORR is supportive of the work being done by the Romney, Hythe and Dymchurch Railway into the development of PLC based level crossing control systems and welcomes innovative new approaches that can reduce industry costs while maintaining appropriate levels of safety.

In summary I hope you can be assured that whilst we do not welcome new level crossings, we would not object in principle to crossings being created in this case. There are clearly many details to be developed and I will look forward to hearing from you as the proposals progress.

Yours sincerely

**Eur Ing Ian Raxton**  
**HM Inspector of Railways**
