

Cambridgeshire

County

This profile was published on 4th July 2017

Health Profile 2017

Health in summary

The health of people in Cambridgeshire is generally better than the England average. Cambridgeshire is one of the 20% least deprived counties/unitary authorities in England, however about 13% (14,200) of children live in low income families. Life expectancy for both men and women is higher than the England average.

Health inequalities

Life expectancy is 6.0 years lower for men and 4.7 years lower for women in the most deprived areas of Cambridgeshire than in the least deprived areas.

Child health

In Year 6, 14.9% (840) of children are classified as obese, better than the average for England. The rate of alcohol-specific hospital stays among those under 18 is 39*. This represents 51 stays per year. Levels of teenage pregnancy and GCSE attainment are better than the England average.

Adult health

The rate of alcohol-related harm hospital stays is 638*. This represents 3,981 stays per year. The rate of self-harm hospital stays is 265*, worse than the average for England. This represents 1,777 stays per year. The rate of smoking related deaths is 228*, better than the average for England. This represents 797 deaths per year. Estimated levels of adult excess weight are better than the England average. The rate of people killed and seriously injured on roads is worse than average. Rates of sexually transmitted infections and TB are better than average. Rates of statutory homelessness, violent crime, long term unemployment, early deaths from cardiovascular diseases and early deaths from cancer are better than average.

Local priorities

Priorities in Cambridgeshire are to address the impacts of population growth and ageing, mental health issues and health inequalities by embedding public health improvement throughout local government and the NHS. For more information see <http://cambridgeshireinsight.org.uk>

Population: summary characteristics

	Males	Females	Persons
Cambridgeshire (population in thousands)			
Population (2015):	324	323	647
Projected population (2020):	340	337	677
% people from an ethnic minority group:	5.6%	4.9%	5.2%
Dependency ratio (dependants / working population) x 100			59.6%

England (population in thousands)			
Population (2015):	27,029	27,757	54,786
Projected population (2020):	28,157	28,706	56,862
% people from an ethnic minority group:	13.1%	13.4%	13.2%
Dependency ratio (dependants / working population) x 100			60.7%

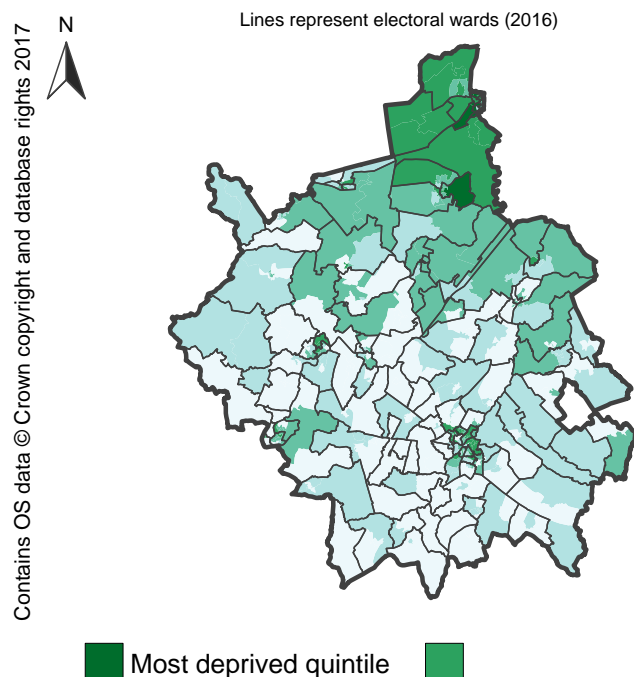

The age profile and table present demographic information for the residents of the area and England. They include a 2014-based population projection (to 2020), the percentage of people from an ethnic minority group (Annual Population Survey, October 2014 to September 2015) and the dependency ratio.

The dependency ratio estimates the number of dependants in an area by comparing the number of people considered less likely to be working (children aged under 16 and those of state pension age or above) with the working age population. A high ratio suggests the area might want to commission a greater level of services for older or younger people than those areas with a low ratio.

- Cambridgeshire 2015 (Male)
- Cambridgeshire 2015 (Female)
- England 2015
- Cambridgeshire 2020 estimate

Deprivation: a national view

The map shows differences in deprivation in this area based on national comparisons, using national quintiles (fifths) of the Index of Multiple Deprivation 2015 (IMD 2015), shown by lower super output area. The darkest coloured areas are some of the most deprived neighbourhoods in England.

This chart shows the percentage of the population who live in areas at each level of deprivation.

Life expectancy: inequalities in this local authority

The charts show life expectancy for men and women in this local authority for 2013-15. The local authority is divided into local deciles (tenths) by deprivation (IMD 2015), from the most deprived decile on the left of the chart to the least deprived decile on the right. The steepness of the slope represents the inequality in life expectancy that is related to deprivation in this local area. If there was no inequality in life expectancy the line would be horizontal.

Life expectancy gap for men: 6.0 years

Life expectancy gap for women: 4.7 years

Health inequalities: changes over time

These charts provide a comparison of the changes in death rates in people under 75 (early deaths) between this area and England. Early deaths from all causes also show the differences between the most and least deprived local quintile in this area. Data from 2010-12 onwards have been revised to use IMD 2015 to define local deprivation quintiles (fifths), all prior time points use IMD 2010. In doing this, areas are grouped into deprivation quintiles using the Index of Multiple Deprivation which most closely aligns with time period of the data. This provides a more accurate way of discriminating changes between similarly deprived areas over time.

Early deaths from all causes: men

Early deaths from all causes: women

Early deaths from heart disease and stroke

Early deaths from cancer

Data points are the midpoints of three year averages of annual rates, for example 2005 represents the period 2004 to 2006. Where data are missing for local least or most deprived, the value could not be calculated as the number of cases is too small.

▲ England average ● Local average ■ Local least deprived ◆ Local most deprived ■ Local inequality

Health summary for Cambridgeshire

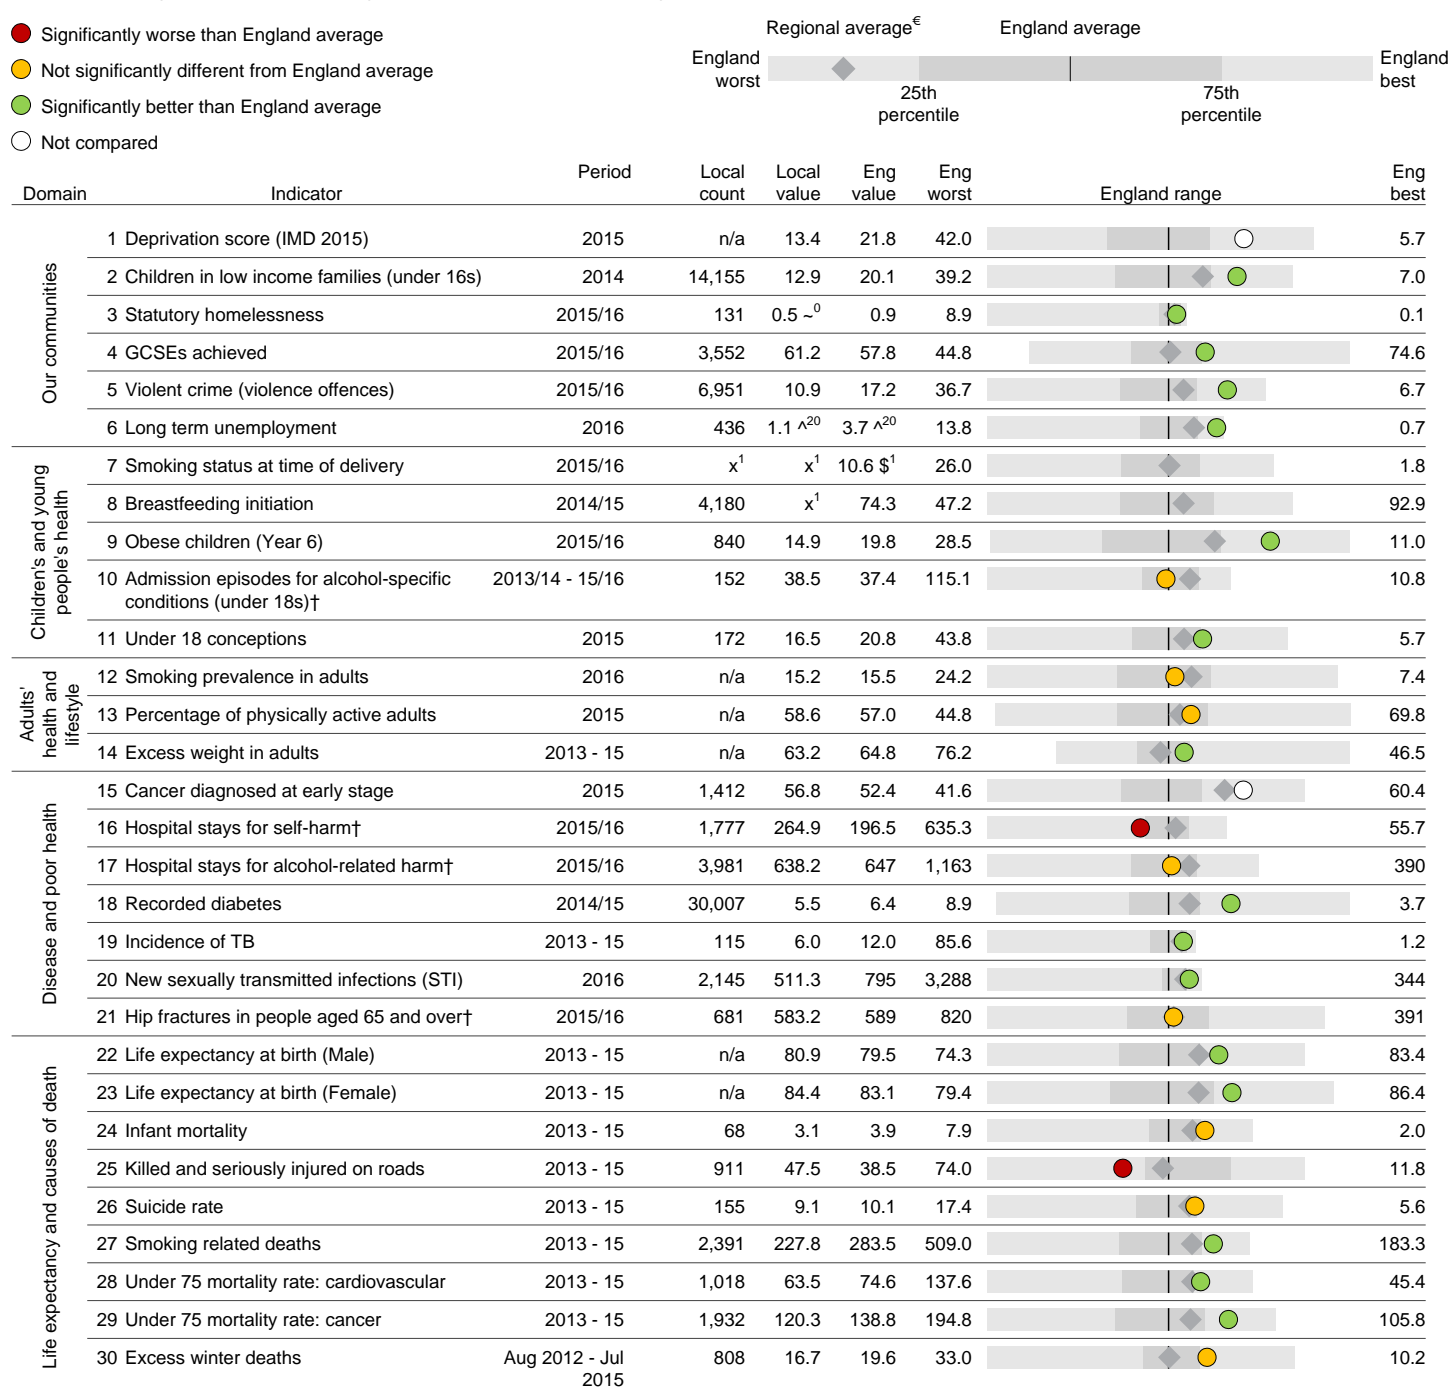

The chart below shows how the health of people in this area compares with the rest of England. This area's result for each indicator is shown as a circle. The average rate for England is shown by the black line, which is always at the centre of the chart. The range of results for all local areas in England is shown as a grey bar. A red circle means that this area is significantly worse than England for that indicator; however, a green circle may still indicate an important public health problem.

● Significantly worse than England average

● Not significantly different from England average

● Significantly better than England average

Fenland

District

This profile was published on 4th July 2017

Health Profile 2017

Health in summary

The health of people in Fenland is varied compared with the England average. About 21% (3,700) of children live in low income families. Life expectancy for men is lower than the England average.

Health inequalities

Life expectancy is 5.9 years lower for men in the most deprived areas of Fenland than in the least deprived areas.

Child health

In Year 6, 20.0% (174) of children are classified as obese. The rate of alcohol-specific hospital stays among those under 18 is 38*. This represents 7 stays per year. Levels of GCSE attainment and breastfeeding initiation are worse than the England average.

Adult health

The rate of alcohol-related harm hospital stays is 731*, worse than the average for England. This represents 729 stays per year. The rate of self-harm hospital stays is 311*, worse than the average for England. This represents 293 stays per year. Estimated levels of adult excess weight, smoking and physical activity are worse than the England average. Rates of sexually transmitted infections and TB are better than average. Rates of violent crime and long term unemployment are better than average.

Local priorities

Local priorities focus on healthy lifestyles to reduce heart disease and diabetes, meeting the needs of our ageing population, and improving partnership working. For more information see <http://cambridgeshireinsight.org.uk>

Huntingdonshire

District

This profile was published on 4th July 2017

Health Profile 2017

Health in summary

The health of people in Huntingdonshire is varied compared with the England average. Huntingdonshire is one of the 20% least deprived districts/unitary authorities in England, however about 12% (3,700) of children live in low income families. Life expectancy for both men and women is higher than the England average.

Health inequalities

Life expectancy is 3.9 years lower for men and 5.3 years lower for women in the most deprived areas of Huntingdonshire than in the least deprived areas.

Child health

In Year 6, 15.8% (266) of children are classified as obese, better than the average for England. The rate of alcohol-specific hospital stays among those under 18 is 54*, worse than the average for England. This represents 20 stays per year. Levels of teenage pregnancy and breastfeeding initiation are better than the England average.

Adult health

The rate of alcohol-related harm hospital stays is 590*, better than the average for England. This represents 1,019 stays per year. The rate of self-harm hospital stays is 227*, worse than the average for England. This represents 387 stays per year. Estimated levels of adult excess weight are worse than the England average. The rate of people killed and seriously injured on roads is worse than average. Rates of sexually transmitted infections and TB are better than average. Rates of statutory homelessness, violent crime, long term unemployment, early deaths from cardiovascular diseases and early deaths from cancer are better than average.

Local priorities

Local priorities include reducing excess weight in the worst affected areas, improving mental health, and supporting older people to live independently, safely and well. For more information see <http://cambridgeshireinsight.org.uk>

East Cambridgeshire

District

This profile was published on 4th July 2017

Health Profile 2017

Health in summary

The health of people in East Cambridgeshire is generally better than the England average. East Cambridgeshire is one of the 20% least deprived districts/unitary authorities in England, however about 10% (1,600) of children live in low income families. Life expectancy for both men and women is higher than the England average.

Health inequalities

Life expectancy is 3.9 years lower for men in the most deprived areas of East Cambridgeshire than in the least deprived areas.

Child health

In Year 6, 15.3% (117) of children are classified as obese, better than the average for England. The rate of alcohol-specific hospital stays among those under 18 is 28*. This represents 5 stays per year. Levels of teenage pregnancy are better than the England average.

Adult health

The rate of alcohol-related harm hospital stays is 589*, better than the average for England. This represents 498 stays per year. The rate of self-harm hospital stays is 253*, worse than the average for England. This represents 206 stays per year. Estimated levels of adult excess weight are worse than the England average. The rate of people killed and seriously injured on roads is worse than average. Rates of sexually transmitted infections and TB are better than average. Rates of violent crime, long term unemployment, early deaths from cardiovascular diseases and early deaths from cancer are better than average.

Local priorities

Local priorities include healthy lifestyles, supporting older people to live independently, safe and well and tackling health inequalities including homelessness. For more information see <http://cambridgeshireinsight.org.uk>

Projected population (2020):	28,157	28,706	56,862
% people from an ethnic minority group:	13.1%	13.4%	13.2%
Dependency ratio (dependants / working population) x 100			60.7%

* - value suppressed due to small numbers

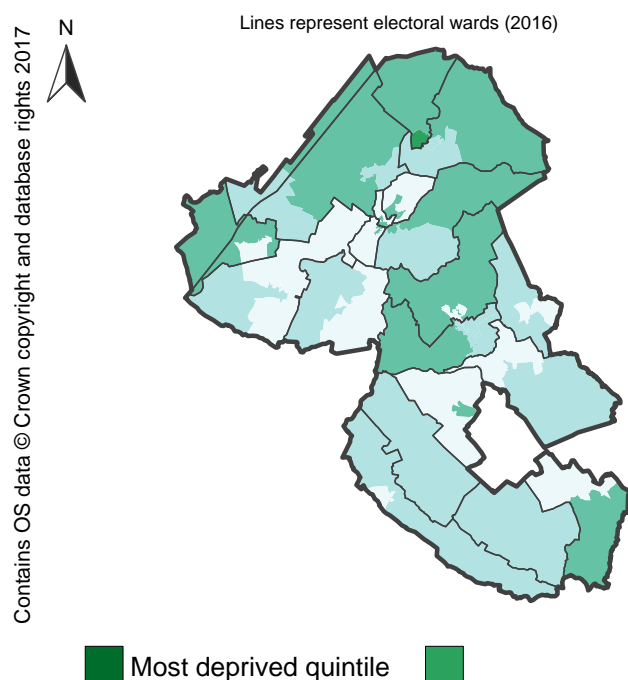

The age profile and table present demographic information for the residents of the area and England. They include a 2014-based population projection (to 2020), the percentage of people from an ethnic minority group (Annual Population Survey, October 2014 to September 2015) and the dependency ratio.

The dependency ratio estimates the number of dependants in an area by comparing the number of people considered less likely to be working (children aged under 16 and those of state pension age or above) with the working age population. A high ratio suggests the area might want to commission a greater level of services for older or younger people than those areas with a low ratio.

● East Cambridgeshire 2015 (Male) — England 2015
● East Cambridgeshire 2015 (Female) — East Cambridgeshire 2020 estimate

Deprivation: a national view

The map shows differences in deprivation in this area based on national comparisons, using national quintiles (fifths) of the Index of Multiple Deprivation 2015 (IMD 2015), shown by lower super output area. The darkest coloured areas are some of the most deprived neighbourhoods in England.

This chart shows the percentage of the population who live in areas at each level of deprivation.

Life expectancy: inequalities in this local authority

The charts show life expectancy for men and women in this local authority for 2013-15. The local authority is divided into local deciles (tenths) by deprivation (IMD 2015), from the most deprived decile on the left of the chart to the least deprived decile on the right. The steepness of the slope represents the inequality in life expectancy that is related to deprivation in this local area. If there was no inequality in life expectancy the line would be horizontal.

Life expectancy gap for men: 3.9 years

Life expectancy gap for women: 1.5 years

Health inequalities: changes over time

These charts provide a comparison of the changes in death rates in people under 75 (early deaths) between this area and England. Early deaths from all causes also show the differences between the most and least deprived local quintile in this area. Data from 2010-12 onwards have been revised to use IMD 2015 to define local deprivation quintiles (fifths), all prior time points use IMD 2010. In doing this, areas are grouped into deprivation quintiles using the Index of Multiple Deprivation which most closely aligns with time period of the data. This provides a more accurate way of discriminating changes between similarly deprived areas over time.

Early deaths from all causes: men

Early deaths from all causes: women

Early deaths from heart disease and stroke

Early deaths from cancer

Data points are the midpoints of three year averages of annual rates, for example 2005 represents the period 2004 to 2006. Where data are missing for local least or most deprived, the value could not be calculated as the number of cases is too small.

▲ England average ● Local average ■ Local least deprived ▲ Local most deprived ■ Local inequality

Health summary for East Cambridgeshire

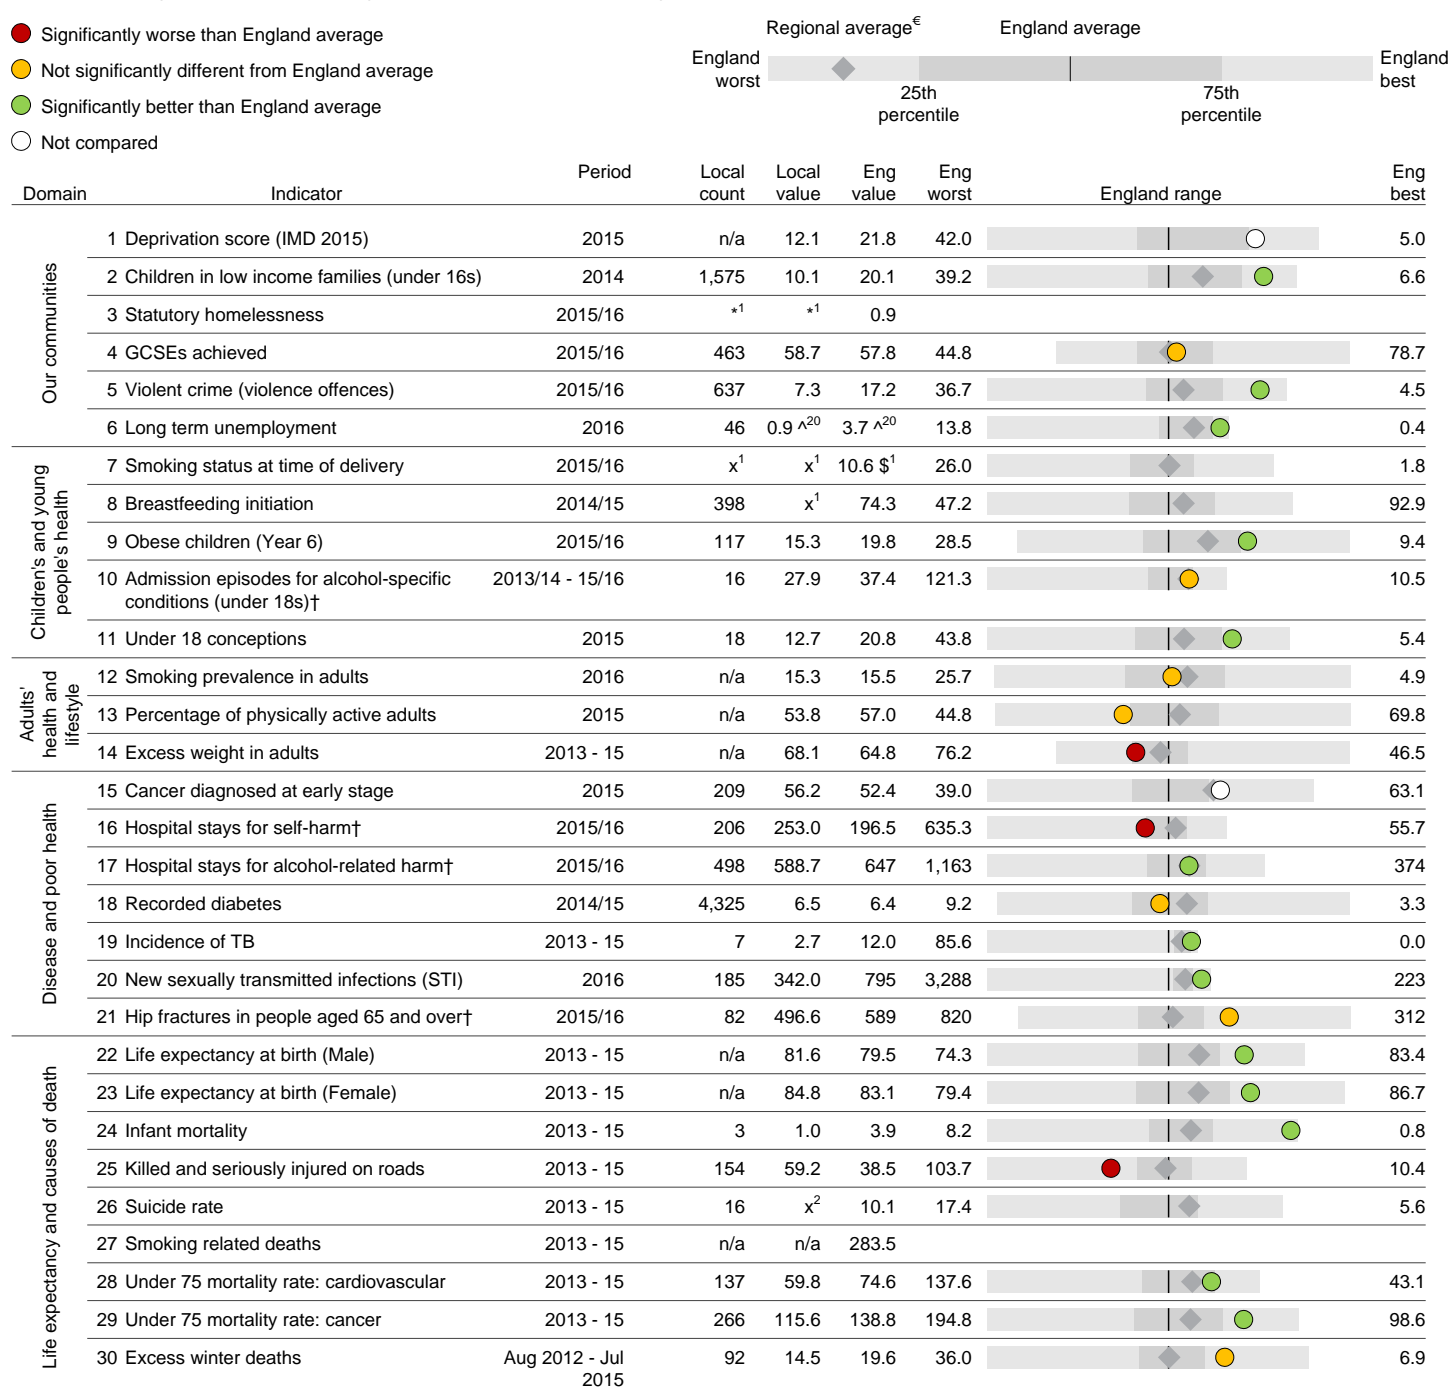

The chart below shows how the health of people in this area compares with the rest of England. This area's result for each indicator is shown as a circle. The average rate for England is shown by the black line, which is always at the centre of the chart. The range of results for all local areas in England is shown as a grey bar. A red circle means that this area is significantly worse than England for that indicator; however, a green circle may still indicate an important public health problem.

● Significantly worse than England average

● Not significantly different from England average

● Significantly better than England average

South Cambridgeshire

District

This profile was published on 4th July 2017

Health Profile 2017

Health in summary

The health of people in South Cambridgeshire is generally better than the England average. South Cambridgeshire is one of the 20% least deprived districts/unitary authorities in England, however about 9% (2,400) of children live in low income families. Life expectancy for both men and women is higher than the England average.

Health inequalities

Life expectancy is 3.9 years lower for men in the most deprived areas of South Cambridgeshire than in the least deprived areas.

Child health

In Year 6, 12.6% (191) of children are classified as obese, better than the average for England. The rate of alcohol-specific hospital stays among those under 18 is 25*, better than the average for England. This represents 9 stays per year. Levels of teenage pregnancy and GCSE attainment are better than the England average.

Adult health

The rate of alcohol-related harm hospital stays is 558*, better than the average for England. This represents 840 stays per year. The rate of self-harm hospital stays is 198*. This represents 293 stays per year. The rate of people killed and seriously injured on roads is worse than average. Rates of sexually transmitted infections and TB are better than average. Rates of statutory homelessness, violent crime, long term unemployment, early deaths from cardiovascular diseases and early deaths from cancer are better than average.

Local priorities

Local priorities include supporting the independence of older people, ensuring access to mental health services, and creating a healthy environment through new housing development. For more information see <http://cambridgeshireinsight.org.uk>
