# East West Rail Performance Assessment 

20 January 2020

Wilson Fung, Matthew Bates, Tim Gordon

## Background

The Systems Analysis team was remitted to undertake a range of performance analysis to assess the proposed East West Rail (EWR) scheme. Three work packages were carried out for this assessment.

## 1. TRAIL Whole System Modelling

To provide an estimate of service performance for a specified working timetable and input assumptions. It captures service operations within a Railway System with defined infrastructure, rolling stock and operational Reliability, Availability and Maintainability (RAM) characteristics.
2. Signalling Performance Assessment (SPA) and Timetable Validity

To investigate the proposed values in the timetable are valid and within the technical values. This involves simulating junction margin and examining historic delay and dwell overruns.
3. Performance benchmark of the existing railway system

Involved interrogation of the NR Business systems to establish the infrastructure reliability, and examine at a high level, the impact of any service affecting failures within the East West Rail area. The main objective of this work package was to assess the observed performance of infrastructure assets, in terms of impact on train service.

## East West Rail TRAIL Whole System Modelling <br> 

Systems Analysis Team
Safety, Technical \& Engineering
20 January 2020
Wilson Fung

TRAIL is a discrete event simulator (Monte Carlo). It is an occupancy model which simulates the movements of services across the infrastructure network. It is used to output service reliability (journey lateness).

## Scope

- Geographic scope of the TRAIL modelling is indicated in the diagram.
- Modelled Baseline \& Option Timetable supplied by the Capacity Analysis Team.
- Performance data (Infrastructure \& Operational Failures) are based on 2018/19 period.

## Assumptions

- At the model boundaries, historic (2018/19) lateness distribution are modelled to simulate the effect of the late train entering the model scope.
- Duplicated freight paths in the timetable are removed.

Journey Lateness Output (1)

Journey Lateness Output (1)

## Summary

- Based on the current assumption, the model indicates an estimate drop of $0.9 \%$ in PPM with the introduction of EWR services.
- The output PPM figures is indicative only because to the limited scope of the model as the true impact of the service outside the geographic scope is not fully capture.
- It is recommended that a detailed timetable modelling should be carry out to deconflict the inherit delay in the plan. i.e. correct route selection for each services.
- It is also recommended that the TRAIL modelling scope should be extended so that it can capture the true impact of the delay propagation.

## Executive Summary

## NetworkRail

- In the option timetable, 42 services at Oxford have less than 10 minutes planned turnaround time. However, in the base timetable there are no planned passenger services with less than 10 minutes turnaround time. There is a risk that the current turnaround process cannot reliably achieve the reduce turnaround time.
- The service interval at MKC Platform 2 A is sufficient that it poses no significant concern that it will affect the performance (Reoccupation of 3 mins. Technical value is 1 min 47 seconds).
- 14 services at Oxford is vulnerable to late departure due to late arrivals and the tight planned turnaround time. Recommend these services to be revisited in future to improve the timetable robustness.
- Recommend introducing Denbigh Hall South Jn as a mandatory timing point location. This will significantly reduce the probability of conflicting moves at the junction.
- The service interval in the CTP is sufficient on the Up Relief Line at Oxford North Junction to minimise delay.

## Turnaround Time

Planned Turnaround Time is defined as the time require to prepare a train for its next planned departure. Minimum Turnaround Time is the minimum time require for a train to be ready for the next departure.

The turnaround time value play a significant part in performance because it act as a "sponge" to absorb any late arriving services. If the lateness of a service arrival at destination is greater than the minimum turnaround time then it will subsequently cause a late departure which in turn could cause further conflicts down the line.

## Oxford

Current TPRs at Oxford allow a planned 5 minutes turnaround. Historic data shows on average a train arrived 3 minutes late. There are 14 services in the option timetable with less than 8 minutes planned turnaround time. These services are highly likely to be subjected to a late departure. Recommend these services to be revisited in future to improve the timetable robustness.

## Milton Keynes Central

Planned timetabled turnaround times at Milton Keynes Central are significantly larger than at Oxford therefore it post less risk to performance.

| Oxford <br> Platform \# | Arrival Time | Turnaround <br> Time |
| :---: | :---: | :---: |
| $\mathbf{1}$ | $16: 47: 00$ | $05: 00$ |
| $\mathbf{1}$ | $11: 51: 00$ | $06: 00$ |
| $\mathbf{1}$ | $10: 50: 00$ | $07: 00$ |
| $\mathbf{2}$ | $12: 20: 00$ | $07: 00$ |
| $\mathbf{1}$ | $12: 50: 00$ | $07: 00$ |
| $\mathbf{2}$ | $13: 20: 00$ | $07: 00$ |
| $\mathbf{1}$ | $14: 50: 00$ | $07: 00$ |
| $\mathbf{2}$ | $\mathbf{1 5 : 1 9 : 0 0}$ | $07: 00$ |
| $\mathbf{1}$ | $\mathbf{1 5 : 5 2 : 0 0}$ | $07: 00$ |
| $\mathbf{2}$ | $16: 20: 00$ | $07: 00$ |
| $\mathbf{1}$ | $19: 46: 00$ | $07: 00$ |
| $\mathbf{2}$ | $\mathbf{2 1 : 5 0 : 0 0}$ | $07: 00$ |
| $\mathbf{2}$ | $\mathbf{0 9 : 1 9 : 0 0}$ | $08: 00$ |
| $\mathbf{2}$ | $10: 19: 00$ | $08: 00$ |

## 

Platform reoccupation is the time required for one train to depart a platform and another train to stop at the platform viewing the least restrictive aspects possible on its journey.
A VISION ${ }^{\text {TM }}$ analysis of reoccupation of platform 2A at Milton Keynes shows a technical time of 01:47
The minimum timetabled reoccupation time is 03:00 and occurs at the following times

| Milton Keynes Central <br> Platform Reoccupation Time | Departure Time |
| :---: | :---: |
| $03: 00$ | $11: 07: 00$ |
| $03: 00$ | $12: 06: 00$ |
| $03: 00$ | $12: 36: 00$ |
| $03: 00$ | $13: 07: 00$ |
| $03: 00$ | $14: 07: 00$ |
| $03: 00$ | $15: 36: 00$ |
| $03: 00$ | $16: 05: 00$ |
| $03: 00$ | $17: 07: 00$ |
| $03: 00$ | $18: 07: 00$ |

Milton Keynes

With a buffer of $01: 13$, there is very little risk that the 9 trains identified above departing late will delay the arrival of the next train into the platform.
The timetabled separation of one EWR train departing Oxford to the next arriving means no risk is presented at Oxford station.

## Denbigh Hall South Junction (2)

- Number of services in the CTP have been identified with timetable conflicts possibly occurring at Denbigh Hall South Jn. A sample of these occurrences are indicated below.

- These possible conflicts could be mitigated by introducing Denbigh Hall South Jn as a mandatory timing point location. This will significantly reduce the probability of these conflicting moves as it will create TPR specifically for this crossing move at this junction and not relying on signallers prioritising services.

## Technical Scope \& Approach

EWR Geographical Scope

| EWR Route Sectors | ELR | Start (km) | End (km) | Strategic Route Desc |
| :---: | :---: | :---: | :---: | :---: |
| Midland Main Line | BBM | 0.000 | 27.076 | Bletchley to Bedford |
| Didcot Chester Line | DCL | 102.012 | 105.968 | Oxford - Coventry |
| Bicester Town Branch | OXD | 0.000 | 51.498 | Bicester Town Branch |
| Bletchley to Bicester Line | DHF | 0.000 | 3.045 | Denbigh Hall North Junction |
|  | BFO | 0.000 | 3.218 | Other Freight Lines |
| Marylebone to Claydon Junction | MCJ2 | -1.609 | 81.614 | Amersham - Aylesbury Vale |
|  | MCJ3 | 61.446 | 260.712 | Other Freight Lines |
|  | MCJ4 | 0.000 | 1.608 | Other Freight Lines |
| Chiltern Main Line | NAJ2 | 39.62 | 54.49 | Marylebone - Aynho Jcn |
|  | NAJ3 | 0.000 | 29.53 | Marylebone - Aynho Jcn |
|  | BSG | 0.000 | 32.756 | Not Defined |

## EWR Route Sectors

Performance Benchmark is based on examination of historic FMS and TRUST data between 18 Sept16 (P7 16/17) and 14 Sep19 (P6 19/20).

Note: West Coast Mainline is excluded from the study.

## Distribution of Delay by All KPl's

| Incident Category | SA Failures | PfPI Minutes | Delay Cost | SA Failures (\%) | PfPI Minutes (\%) | Delay Cost (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Infrastructure | 267 | 55,122 | 2,227,482 | 2.9\% | 39.3\% | 42.1\% |
| Ops, Planning, \& Commercial | 2,108 | 25,745 | 1,046,958 | 23.2\% | 18.3\% | 19.8\% |
| TOC - Mechanical | 426 | 19,298 | 637,946 | 4.7\% | 13.8\% | 12.0\% |
| T\&V, Excludables \& Other | 1,959 | 16,068 | 575,146 | 21.5\% | 11.4\% | 10.9\% |
| Freight - Ops | 3,783 | 15,747 | 539,103 | 41.6\% | 11.2\% | 10.2\% |
| TOC - Ops | 221 | 6,208 | 195,481 | 2.4\% | 4.4\% | 3.7\% |
| Stations | 328 | 2,056 | 70,236 | 3.6\% | 1.5\% | 1.3\% |
| Weather | 7 | 100 | 3,002 | 0.1\% | 0.1\% | 0.1\% |
|  |  |  |  |  |  |  |
| Grand Total | $9,099$ | $140,343$ | $5,295,354$ |  |  |  |

The Distribution of Delay by KPI shows that infrastructure related KPI codes account for approximately:

- $39.3 \%$ of the total delay minutes,
- $42.1 \%$ of the total cost
